REPORT OF THE REGISTRAR-GENERAL FOR THE YEAR 1933.

TO THE MINISTER FOR LOCAL GOVERNMENT AND PUBLIC HEALTH.

This Report contains detailed information regarding the numbers of marriages, births and deaths registered during the year 1933, and also particulars of population, emigration, immigration and meteorology. The Report is in three sections:—Section I—Text, dealing with important statistical data in connection with the population, marriages, births and deaths during the year; Section II—Tables, showing the principal figures since the commencement of registration; and Section III—Abstracts, giving the actual numbers registered during 1933 for Saorstát Éireann as a whole, and for the different administrative areas.

Mí na Samhna, 1934.

E. P. McCARRON,
Registrar-General.

GENERAL SUMMARY.

It is estimated that the total number of persons in Saorstát Éireann in the middle of 1933 was 2,993,000. This figure is 19,000 more than the corresponding figure for 1932 and 21,000 above the population according to the Census of 1926.

When compared with the figures for 1932, the numbers of marriages and births registered in 1933 show an increase, and the number of deaths a decrease.

The number of marriages registered was 13,992; this figure is 963 more than the number in the preceding year, and 156 more than the average (13,836) for the ten years 1923–32. The rates per 1,000 of population were 4·67 in 1933; 4·38 in 1932; and the average rate for the period 1923–32 was 4·66.

In Northern Ireland the rate for 1933 was 6·00; in England and Wales, 7·9; and in Scotland, 6·97.

The number of births registered was 57,364, being 1,124 more than that recorded for 1932. The average annual number during the period 1923–32 was 59,753. The birth-rate in 1933 was 19·17 per 1,000; in 1932 it was 18·91; and during the period 1923–32 the average rate was 20·11.

The birth-rate in Northern Ireland in 1933 was 19·36, in England and Wales 14·4, and in Scotland 17·62.

The number of illegitimate births registered was 2,004, equal to 3·49 per cent. of the total births, as compared with a percentage of 3·23 in 1932 and 3·37 for 1931. In Northern Ireland the percentage in 1933 was 5·03, in England and Wales 4·38, and in Scotland 6·89.

The number of deaths registered during the year was 40,539, showing a decrease of 2,445 when compared with the figure for the previous year. The rate per 1,000 of the population was 13·54 for 1933, 14·45 for 1932 and 14·44 for the period 1923–32.

In Northern Ireland the death-rate in 1933 was 14·3, in England and Wales 12·3, and in Scotland 13·20.

Of the diseases returned as the cause of the deaths registered during 1933, heart disease accounted for 15 per cent., tuberculosis for 9 per cent., cancer for 8 per cent., pneumonia for 6 per cent. and each of cerebral hæmorrhage and bronchitis for 5 per cent.

The number of deaths from tuberculosis was 3,510. This number is 166 below that for 1932 and is the lowest yet recorded. The rate per 1,000 of the population for 1933 was 1·17; for 1932 it was 1·24 and for the decennial period 1923–32 it was 1·40.

Deaths from cancer numbered 3,266, showing a decrease of 46 when compared with the figure for 1932. The number in that year was 3,312, and in 1931 it was 3,294. The rates were 1·09, 1·11 and 1·11 in the respective years.

Deaths from diseases and accidents of pregnancy and childbirth numbered 255. This number is equivalent to a rate of 4·44 per 1,000 births, compared with an average of 4·64 in the ten years 1923-32. The rate for these deaths for all urban districts was 3·19 per 1,000 births, and for all rural districts, 5·17, in comparison with 4·20 and 4·76 respectively, in 1932.

The deaths of 3,742 infants under one year of age were registered during the year. This number is 318 less than the number in 1932, and is equivalent to a rate of 65 per 1,000 births. The corresponding rate for the previous year was 72. The rates per 1,000 births for urban and rural areas were 85 and 54, respectively, in 1933; and 95 and 59 in 1932.

Among legitimate infants the mortality was 60 per 1,000 births, and among the illegitimate it was 209. For Northern Ireland the legitimate infant death-rate was 76, and the illegitimate, 148, and for England and Wales the corresponding rates were 62 and 107 respectively.

The number of deaths attributed to violence was 1,017. These comprise 103 suicidal, 13 homicidal, and 901 accidental deaths. The numbers in 1932 were 110, 16, and 851 respectively. An increase has taken place in the number of deaths ascribed to road traffic, the figure for 1933 being 217, as compared with 181 in the preceding year.

Issue of Authority for Registration.—Births and deaths which have not been registered within one year of their occurrence can only be registered on the authority of the Registrar-General. During 1933, authority was issued for the registration of 811 births and 150 deaths.

Vaccinations.—As returned by the Registrars, the successful primary vaccinations for the year 1933 numbered 34,795, equivalent to 61 per cent. of the total births registered.

Searches and Certificates.—The number of searches made during the year 1933, in the registers of marriages, births and deaths in respect of which fees were received, was 23,360, the certificates issued numbered 11,477, and the amount of fees received was £3,052 16s. 6d. In the year 1932 the figures were as follows—Searches, 19,265; certificates, 12,031, and fees, £2,951 16s. 0d.

TABLE A.—Showing for each of the years 1923-33 the estimated Population* ; the numbers of MARRIAGES, BIRTHS and DEATHS registered, with the rates per 1,000 of the estimated Population represented thereby; and the averages for the ten years 1923-32; also particulars relating to Northern Ireland for the year 1933.

* See page 2.

MOVEMENT OF POPULATION.

It is estimated that the population of Saorstát Éireann at the middle of 1933 was 2,993,000 persons, males numbering 1,524,000 and females 1,469,000. This estimate has been based on the figures obtained at the Census of 1926. The number of births and immigrants in each year has been added to the Census figure and the number of deaths and emigrants deducted therefrom. The estimated population thus obtained shows an increase of 19,000 persons over the estimated figure for 1932 and an increase of 11,000 over the Census population. There is thus a continuance of the upward movement which commenced in 1930, which is due to the fact that emigration has so declined as to be now less than immigration, and that consequently the natural excess of births over deaths has its full effect on the population.

In Table 1, page 2, will be found the estimated populations, by sexes, for each of years from 1851 to 1933.

TABLE B.—Showing the average excess of births over deaths (natural increase), the net migration, and the actual variations in the population in the period 1864–71 and in the intercensal periods between 1871 and 1926, with the average rates per 1,000 of the population; also similar particulars for the years 1927–1933.

Intercensal Period, &c.	Average Excess of Births over Deaths (Natural Increase)		Average Net Migration Outwards (—); Inwards (+)		Average variation in Population

Emigration and Immigration.—The returns furnished by the Department of Industry and Commerce show that the numbers of emigrants to and immigrants from places out of Europe and not within the Mediterranean Sea during the year 1933 were 975 and 3,192, respectively, including 422 to and 2,470 from the United States—the corresponding figures for Canada being 62 and 224; for Australia 187 and 115; for New Zealand 33 and 43; for the Union of South Africa 44 and 85; for India 95 and 95; and for other countries 132 and 160, respectively. With the exception of Australia and India the immigrants into Saorstát Éireann from the areas specified outnumber the emigrants thereto.

The following Table gives particulars of emigrants and their destinations in 1933 as compared with the eight years preceding:—

TABLE C.—Number of EMIGRANTS and IMMIGRANTS (of Saorstát Éireann and alien nationality) to and from places out of Europe and not within the Mediterranean Sea, together with the destinations of Emigrants during each of the years 1925–33.

YEAR	Number of Emigrants by Destinations								Number of Immigrants.

1933	422	62	187	33	44	95	132	975	3,192

MARRIAGES.

During the year under review 13,992 marriages were registered. This figure is equivalent to a rate of 4.67 per 1,000 of the population and is the highest rate recorded since the year 1924. In the period 1925-7 the rate declined steadily but rose again in the three succeeding years. In 1931 and 1932 the rates fell to 4.44 and 4.38 per 1,000 and for 1933 the rate rose to 4.67. The average rate for the ten years ended with 1932 was 4.66 per 1,000.

Marriages celebrated in accordance with the rites and ceremonies of the Catholic church numbered 13,093 (equal to 93.6 per cent. of the total), and other marriages 899. As compared with the numbers in 1932, an increase of 916 has occurred in Catholic marriages and of 47 in others. The total number of the latter marriages comprise 646 celebrated according to the rites and ceremonies of the Protestant Episcopal Church; 119 in Presbyterian Meeting-houses; 51 in "Registered Buildings" belonging to various other religious denominations; 70 by civil contract in the Registrars' offices; 2 according to the usages of the Society of Friends; and 11 according to the Jewish rites.

According to the Census of 1926, Catholics represented 92.6 per cent. of the population, Protestant Episcopalians 5.5 per cent., Presbyterians 1.1, Methodists 0.4, and all other denominations 0.4.

The number of Catholic marriages is equivalent to a rate of 4.72 per 1,000 of the estimated Catholic population, or 0.03 above the average rate for the preceding ten years, and the rate for other marriages was 4.06 per 1,000 of all persons other than Catholics in the population, or 0.16 below the average, as shown in the following table. These rates, however, must be accepted with reserve, as the estimate of the population on which the rates have been calculated is based on the respective proportions according to the Census of 1926.

TABLE D.—MARRIAGES registered in 1933, and in each of the previous ten years, according to the MODES OF CELEBRATION; with the rate per 1,000 of the population represented by Catholic and all other marriages.

YEARS	Marriages registered other than Catholic							Catholic Marriages	Total Marriages Registered	Rate per 1,000 of estimated corresponding Population represented by

In the Abstract of Marriages, pages 42-3, particulars are given of the condition of the persons married. From these it appears that marriages between bachelors and spinsters comprised 93.4 per cent. of the total marriages; those of widowers and spinsters, 4.4 per cent.; bachelors and widows, 1.4 per cent.; and those of widowers and widows, 0.8 per cent. These figures show that of the men married 5.2 per cent. were widowers, and of the women 2.2 per cent. were widows, or in 74 instances in every 1,000 marriages, one or both of the contracting parties had been married before. (See Table F.)

In the following Table, the county, county borough and provincial rates per 1,000 of the population are given for 1933, in comparison with the annual average for 1910-12 and 1925-7.

TABLE E.—MARRIAGE-RATES (per 1,000 of the population) for counties, county boroughs and provinces, 1910-12, 1925-7, and 1933.

Counties, &c.	Marriages per 1,000 of Population			Counties, &c.	Marriages per 1,000 of Population		
	Annual Average 1910-12	Annual Average 1925-7	Year 1933		Annual Average 1910-12	Annual Average 1925-7	Year 1933

Wicklow ...	4.55	3.97	3.87	Connaught ...	4.10	3.90	3.71
Leinster ...	5.57	5.22	5.60	Cavan ...	5.06	4.27	3.61
Clare ...	3.75	3.55	3.46	Donegal ...	4.14	3.68	3.93
Cork ...	4.34	3.53	3.84	Monaghan ...	4.87	3.94	3.84
Cork Co. Borough ...	7.99	8.21	8.40	Ulster (pt. of) ...	4.55	3.90	3.82

The salient feature of this table is the marked difference between the marriage rates for the cities and those for the counties. Thus, the rate for Limerick county borough was 8.47; followed by Cork county borough (8.40), City of Dublin (7.17), Dublin county (6.48), and Waterford county borough (5.44), while the lowest rates are found in Laoighis (2.77), Longford (3.31), Mayo (3.40), Clare (3.46), and Leitrim (3.58).

It must be borne in mind, however, that as marriages are registered in the area in which they take place, the figures upon which the rates given above are based include marriages of persons who are not residents of the respective areas. An examination of the returns for the urban areas reveals the fact that many of the marriages recorded are of persons from the surrounding rural areas.

Among the provinces the highest rate is found in Leinster, viz., 5.60 per 1,000, and the lowest in Connaught 3.71.

The marriage-rate for Northern Ireland in 1933 was 6.0, for England and Wales 7.9, and for Scotland 7.0, as compared with 4.7 in Saorstát Éireann.

In Table 5 the number of marriages, distinguishing Catholic and other marriages, is given by quarterly periods for each of the years 1923-33, together with the average rate for the ten years 1923-32 and for the year 1933. The marriage rate for the first quarter of 1933 was 4.8 per 1,000 of the population, for the second 4.6, for the third 4.7, and for the fourth 4.5.

From Table 5 it appears that the rate for Catholic marriages was highest in the first quarter of the year and that the rates for the other quarters were practically equal. On the other hand the rate for the remaining marriages was highest in the third quarter and lowest in the first. When the rates for the total marriages are considered, very little difference exists in the figures for the quarterly periods.

Particulars regarding marriages of persons not of full age, and re-marriages, are given in the following table (F), for each of the years 1922-33.

TABLE F.—Showing as regards Marriages in Saorstát Éireann, during the years 1922-33, the proportion of PERSONS NOT OF FULL AGE, and of RE-MARRIAGES.

YEAR	Total Marriages	Persons not of Full Age		Re-Marriages	
		of 100 Men Married	of 100 Women Married	Widowers	Widows
				of 100 Men Married	of 100 Women Married
1922	15,141	1.56	6.22	6.81	4.34
1923	15,632	1.25	5.09	6.82	3.65
1924	14,822	1.27	4.63	6.29	3.61
1925	13,820	1.05	5.45	6.85	3.79
1926	13,570	1.50	6.53	6.33	3.21
1927	13,418	1.39	7.05	6.33	3.26
1928	13,716	1.58	7.38	6.37	3.40
1929	13,598	1.49	7.09	6.53	2.98
1930	13,631	1.91	7.41	6.68	3.23
1931	13,133	1.52	7.33	6.31	3.02
1932	13,029	1.73	7.71	5.73	2.87
1933	13,992	1.62	7.53	5.20	2.22

The Schedules to the Acts 7 and 8 Vic., cap. 81, and 26 and 27 Vic., cap. 90, indicate that the law does not require that the ages of the contracting parties should be entered in the Register Book or Certificate. All that is necessary is that each party should be described as "of full age" or "minor," as the case may be, so that a complete record of the ages of the persons married is not available.

The proportion of husbands who married under age was highest in the province of Leinster, viz., 2.2 per cent., in Munster it was 1.3, in Connaught 1.1, and in Ulster (part of) 0.6, while the percentage of wives who were minors was for Leinster 9.7, for Munster 5.6, for Connaught 4.7, and for Ulster (part of) 7.8, the proportions for Saorstát Éireann as a whole being 1.6 for husbands and 7.5 for wives.

In Northern Ireland, the proportion per cent. of males married in 1933 who were under age was 3.4, and of females 13.7.

The number of Licences issued by the Registrars during the year 1933 for Marriages in Registered Buildings and in the Registrars' Offices, was 110. On 31st December, 1933, the number of such Registrars of Marriages authorized to grant Licences for Marriages under 7 and 8 Vic., cap. 81, was 101.

Marriage Licences issued by Licensing Ministers of the Protestant Episcopal Church amounted to 572. The number of Licensing Ministers on the 31st December was 150.

The number of Licences for Marriage issued by the Licensing Ministers of the Presbyterian bodies in Saorstát Éireann during the year 1933 was 110, all of which were issued by Ministers of the General Assembly. The number of Licensing Ministers on the 31st December, 1933, was 48, of whom 46 were of the General Assembly and 2 of the United Presbytery or Synod of Munster.

The law does not require this office to keep a register of the churches and chapels of the Catholic Church in which marriages may be solemnised. In the case of the other religious denominations the records in this office show that 1,059 churches and chapels of the Protestant Episcopal Church were, on 31st December, 1933, licensed for the solemnisation of marriages, and that 150 Presbyterian Meeting-houses (148 General Assembly and 2 United Presbytery or Synod of Munster), and 170 Separate Buildings belonging to various other religious denominations were registered for the solemnisation of marriages. The several religious bodies to whom the 170 Separate Buildings belonged are shown in the following list:—

Denominations	No. of Places of Worship	Denominations	No. of Places of Worship
Methodists	130	Salvation Army	2
Reformed Presbyterians	5	Seceders	2
Baptists	8	"The Catholic Apostolic Church"	1
Independents or Congregationalists	6	Welsh Presbyterians	1
Christian Brethren	10	"Undenominational"	4
Moravians or United Brethren	1		
		TOTAL	170

BIRTHS.

The number of births registered in 1933 was 57,364. The equivalent rate was 19·17 per 1,000 of the population. The number is 1,124 more than the figure for the previous year and 278 over that for 1931. The rate per 1,000 of the population for 1933 shows an increase of 0·26, when compared with that for 1932, but is 0·13 below that for 1931. When comparing these rates the fact that the population is increasing since 1931 must not be overlooked.

The birth-rate has declined almost since the beginning of registration (1864). The fall was most rapid during the period from 1881-90, the average rate during the ten years from 1871 to 1880 being 26·31, and during 1881-90, 22·88. Between 1891 and 1915 the variations in the birth-rate were slight, but since 1916 the decline has become more noticeable. The figure for the year 1932 is the lowest yet recorded.

A decline has also occurred in most European and other countries for which statistics are available. In this country, however, the birth-rate has always been low, and the fall is not so marked proportionately as it is elsewhere.

The birth-rate in Northern Ireland in 1933 was 19·36; in England and Wales it was 14·4; and in Scotland it was 17·62.

Abstract I. presents the numbers of births in different parts of Saorstát Éireann, both as registered and as corrected by transfer to the area of the parents' residence of births which occurred outside such area.

The birth-rates calculated on the corrected figures are given for provinces, counties, county boroughs and urban and rural areas in Tables 16 and 17. For the province of Leinster the rate was 21·40, for Munster 18·62, for Connaught 17·68, and for Ulster (part of) 16·45, as compared with 20·97, 18·44, 16·90 and 16·36, respectively, in 1932. The increase is greatest in the province of Connaught.

The highest birth-rates, as is usual, are found in the county boroughs, the rate for Waterford being 26·23, for Limerick 25·12, for Dublin 25·04, and for Cork 24·00, followed by 20·94 for Carlow, which is the highest rate for administrative counties. The lowest rates were 15·40 for Cavan, 15·98 for Roscommon, 15·99 for Leitrim, 16·35 for Cork county, 16·47 for Sligo and 16·60 for Monaghan.

From a comparison of the rates for the county boroughs and urban districts in the aggregate and for the combined rural districts with the rates in the preceding year, it appears that the urban rate shows an increase of 0·23 per 1,000, being 23·57 as against 23·34 in 1932, while the corresponding rural rates were 17·30 and 17·02 respectively, an increase of 0·28.

The birth-rate for Belfast county borough in 1933 was 20·71, for Londonderry 25·40, for London 13·2, for Liverpool 19·7, for Edinburgh 15·1, and for Glasgow 19·3.

Illegitimate Births.—Illegitimate births numbered 2,004, equal to 3·5 per cent. of the total births registered, and equivalent to a rate of 0·67 per 1,000 of the population. All these figures represent an increase when compared with 1932, when the number was 1,819, the percentage 3·2, and the rate 0·61.

The rate per cent. of total births in Northern Ireland in 1932 was 5·0, in England and Wales 4·4, and in Scotland 6·9.

The percentages, by provinces, are shown in the following statement for the years 1926-33:—

	Illegitimate Births—per cent. of Total Births.							
	1926.	1927.	1928.	1929.	1930.	1931.	1932.	1933.
Saorstát Éireann	2·81	2·93	3·02	3·18	3·19	3·37	3·23	3·49
Leinster ...	3·36	3·47	3·47	3·64	3·85	3·96	3·73	4·15
Munster ...	2·90	2·79	3·17	3·37	3·13	3·39	3·26	3·33
Connaught ...	1·30	1·41	1·66	1·56	1·46	1·68	1·35	1·90
Ulster (part of) ...	2·77	3·83	3·02	3·45	3·61	3·71	4·30	3·99

Tables 15 and 16 supply the information regarding illegitimacy in 1933 by provinces, counties, and county boroughs. The five counties with the highest rates were Wexford (7·26 per cent. of total births), Carlow (7·06), Laoighis (5·93), Kildare (5·84), and Kilkenny (5·58), and the lowest five were Mayo (1·04), Cork county borough (1·54), Roscommon (1·72), Galway (2·16), and Leitrim (2·68).

Legitimacy Act (1931).—During 1933, the authority of the Registrar General for the re-registration of births under the Legitimacy Act, 1931, was issued in 15 cases.

Proportion of Males to Females.—The births in 1933 comprise 29,381 boys and 27,983 girls. These numbers are in the proportion of 1,050 males to every 1,000 females, a ratio which is 2 less than the average (1,052) for 1923–32. In England and Wales in 1933, the proportion of males born alive to 1,000 females was 1,046, which was one above the average for the ten preceding years, and in Scotland the proportion was 1,072, which was 24 above the average for the ten preceding years.

Table 4 shows the proportions for Saorstát Éireann by periods for the years 1864–1933.

The male children born in wedlock in 1933 numbered 28,412, and the female 26,948, or 1,054 of the former to every 1,000 of the latter, and of the illegitimate children 969 were males and 1,035 females, or 936 boys to every 1,000 girls.

The following statement shows the total number of infants, by sexes, whose births were registered during each quarter of 1933 :—

	1st Quarter	2nd Quarter	3rd Quarter	4th Quarter	Total
Males	7,038	7,615	7,708	6,990	29,381
Females	6,655	7,366	7,214	6,748	27,983
TOTAL	13,693	15,011	14,922	13,738	57,364

Of the total births, 50·0 per cent. were registered in the first six months (181 days).

Multiple Births.—The number of infants born alive in multiple births was 1,419, consisting of 696 pairs of twins and 9 sets of triplets. The twins were 2·43 per cent. of the total number of infants whose births were registered, and the triplets 0·05. In 1932 these percentages were 2·34 and 0·03, respectively.

The number of mothers of living children during the year was 56,650. Of these, 55,945 or 98·75 per cent., gave birth to single infants, 696, or 1·23 per cent., to twins, and 9, or 0·02 per cent., to triplets.

The infants born in wedlock (55,360) comprised 53,972 single infants, 1,364 twins and 24 triplets, these groups bearing the proportions of 97·49 per cent., 2·46 per cent., and 0·05 per cent. to the total number of legitimate births, respectively.

Illegitimate infants included 1,973 single, 28 twin infants and 3 triplet infants, or 98·45 per cent., 1·40 per cent., and 0·15 per cent., respectively, of the 2,004 illegitimate infants registered.

Of the total infants born alive, in cases of multiple births, 741 were males, and 678 females.

It should be borne in mind that the figures given above relate to live births, as still births are not registered, and that, therefore, the birth of one living child and one still born or one living child and two still born is counted as a single birth, and the birth of two living children and one still born is counted as a twin birth.

DEATHS.

During the year 1933 the number of deaths registered was 40,539, equivalent to a rate of 13·54 per 1,000 of the population. The rate shows a decrease of 0·91 when compared with that for the year 1932, and a decrease of 0·90 compared with the average for the 10 years 1923-32. It is the lowest yet recorded. Comparative figures are shown in Table 4, in which is given the average death rate for certain periods from 1864 to 1930 and for the individual years since the year 1923.

The deaths of males numbered 20,610 and the deaths of females 19,929, or 13·52 and 13·57 per 1,000 of the respective male and female populations. The rate for males shows a decrease of 0·88 and that for females a decrease of 0·94 per 1,000 as compared with the corresponding figures for 1932.

For Northern Ireland the death rate in 1933 was 14·28; for England and Wales 12·3, and for Scotland 13·20.

The number of deaths registered in each county, county borough and superintendent registrar's district is given in Abstract I., as well as the number obtained by the transfer to the district of usual residence of deaths of persons which occurred elsewhere in Saorstát Éireann. In Table 16, rates based on the latter numbers are given for provincial, county, urban and rural areas.

Rates based on these figures represent the frequency of death in the population of the particular area, but a fair comparison between the mortalities of different areas cannot be made by such means. The incidence of mortality is effected by the age and sex constitution of the population, factors which vary in different localities. To institute a true comparison, it is necessary to reduce the mortality for different areas to a common basis which will provide a uniform age and sex constitution of population. This has been done by applying the death-rates of males and females in age-groups in the counties and county boroughs to a standard population adopted for the purpose. Such a process is known as the standardisation of death-rates; it has been employed in these Reports for the last four years, and a detailed description and example appeared in the Annual Report for 1930.

The standard population used is that of Saorstát Éireann at the Census of 1926. As a period of eight years has elapsed since the date of the last Census, it is necessary to accept standardised rates with reserve. The essential basis of standardisation is age-distribution, which has possibly undergone considerable change in the past eight years owing to fluctuation in the general population.

The effect of these adjustments is shown in Table (G) on the next page. Rates calculated on the number of deaths for each county and county borough obtained as a result of the application of the system of transfer mentioned above are set forth, together with the standardised rate for each area and the difference is shown in Col. 3.

The result of standardisation is generally to increase the rate for the larger urban areas and the counties situated in close proximity thereto, and to reduce the rate for purely rural areas. This emphasises the contrast between the death-rates in the urban and rural areas.

TABLE G.—Showing the Death-rates in 1933 for Counties, County Boroughs and Provinces.

COUNTIES, ETC.	Death-rates in 1933 per 1,000 population.		
	Corrected for Transfers.	Standardised Rates.	Effect of Standardisation
	(1)	(2)	(3)
Carlow	14.65	14.44	-0.21
Dublin	13.72	15.48	+1.76
City of Dublin	15.20	18.98	+3.78
Kildare	13.73	15.02	+1.29
Kilkenny	13.79	13.83	+0.04
Laoighis	13.68	12.94	-0.74

Wexford	13.41	13.18	-0.23
Wicklow	13.94	13.93	-0.01
Province of Leinster	14.41	15.42	+1.01
Clare	12.54	11.15	-1.39
Cork	12.80	12.93	+0.13
Cork County Borough	15.01	17.81	+2.80
Kerry	11.05	11.07	+0.02
Limerick	13.87	13.97	+0.10
Limerick County Borough	17.90	21.56	+3.66
Tipperary N.R.	13.36	13.13	-0.23
Tipperary S.R.	13.57	14.07	+0.50
Waterford	13.91	13.44	-0.47
Waterford County Borough	14.15	15.58	+1.43
Province of Munster	13.20	13.44	+0.24
Galway	12.51	11.70	-0.81
Leitrim	14.74	12.56	-2.18
Mayo	12.15	11.08	-1.07
Roscommon	12.60	10.75	-1.85
Sligo	13.57	12.11	-1.46
Province of Connaught	12.77	11.51	-1.26
Cavan	13.64	12.23	-1.41
Donegal	13.43	11.93	-1.50
Monaghan	14.46	12.83	-1.63
Province of Ulster (part of)	13.71	12.20	-1.51
Saorstát Éireann	13.54	13.54	—

An example of the modifications, made by standardisation, in the death-rates is afforded by the following statement, which shows the average annual death-rates, by sexes, for 1925-7, compared with the crude rates for certain triennial periods at the time of each of the five preceding censuses.

The triennial periods selected for comparison are those which centre on the years in which the census of population was taken, viz., 1871, 1881, 1891, 1901, 1911, and 1926. It may be assumed that the age and sex constitution of the average population in each of

these triennial periods differed but slightly from that shown in the actual Census figures of the central year.

—	AVERAGE ANNUAL DEATH-RATES—AS RECORDED (CRUDE) AND STANDARDISED—PER 1,000 OF POPULATION.										
	1870-2		1880-2		1890-2		1900-2		1910-2		1925-7
	Crude	Standardised	Crude	Standardised	Crude	Standardised	Crude	Standardised	Crude	Standardised	Death-rate
Persons	16.85	19.03	17.77	20.44	17.91	20.99	17.75	20.36	16.35	15.91	14.48
Males	17.33	19.44	18.10	20.75	17.83	21.06	17.85	20.38	16.32	16.35	14.33
Females	16.39	18.57	17.45	20.11	17.99	20.90	17.65	20.31	16.37	15.49	14.63

This statement shows that the decrease which has taken place in the death-rate in recent years is much greater than appears in the ordinary way from a comparison of crude rates. Thus the decrease between 1870-2 and 1925-7 appears to be 2.37 per 1,000 when measured by crude rates, but by standardisation the true difference is shown to be 4.55 per 1,000.

Similar differences are shown for the other periods except 1910-12; for that period the death-rate is reduced by standardisation; this is due to the fact that the Census results for 1911 showed a high percentage of aged persons.

The following statement shows, by sexes, the number of deaths of persons registered during each quarter of the year 1933.

—	1st Quarter	2nd Quarter	3rd Quarter	4th Quarter	Total.
Males	6,456	4,951	4,265	4,938	20,610
Females	6,462	4,752	3,966	4,749	19,929
TOTAL	12,918	9,703	8,231	9,687	40,539

Of the total deaths 22,621, or 55.8 per cent. were recorded during the first six months, and 17,918, or 44.2 per cent., in the second six months.

The deaths registered in the first quarter of the year were equal to a rate of 17.3 per 1,000 of the population; in the second, 13.0; in the third, 11.0; and in the fourth, 13.0. Compared with the rates for the previous year, the first quarter shows a decrease of 0.4 per 1,000, the second of 2.1, the third of 0.9 and the fourth an increase of 0.1 per 1,000.

In Table 5 the rates for each quarter of 1933 are shown, together with the average figures for the preceding ten years. The decrease in the rate for the second quarter of 1933, when compared with the average, amounts to 2.2 per 1,000, equivalent to a fall of over 14 per cent.

DEATHS IN INSTITUTIONS.

Abstract V. gives particulars relating to deaths by certain causes in institutions, for the country as a whole, and for each province, county and county borough. Deaths in general and special hospitals numbered 4,011, in mental hospitals, 1,056, and in county homes and hospitals, etc., 6,780; and 28,692 occurred elsewhere, chiefly at the homes of deceased. These figures are in the respective proportions of 9.9, 2.6, 16.7, and 70.8 per cent. of the total number of deaths.

These rates, when compared with the figures for earlier years, indicate an increasing tendency to avail of hospital and institution treatment. In 1923 the percentages of deaths in the three classes of institution were 8.1, 2.5, and 12.7, respectively, 76.7 per cent. dying at their own homes.

UNCERTIFIED CAUSES.

The percentage of cases in which the cause of death was not stated to have been certified by a medical practitioner or the coroner was 18.6. The number of such deaths was 7,546. For the year 1932 the percentage was 19.5 and for the decennial period 1923-32 the average figure was 23.9 per cent.

For the most part uncertified deaths are registered in rural districts; the percentages for these districts in 1933 being 26.4; whereas in urban districts it was only 2.5.

INQUESTS.

The number of deaths registered on certificates issued by coroners as the result of inquests or post-mortem examinations during the year 1933 was 1,299, or one inquest in every 31 deaths registered, as compared with one inquest in every 35 deaths in 1932.

CAUSES OF DEATH.

The causes of the deaths registered during 1933 are given, according to the Detailed International List, by sexes and ages in Abstract IV. In Abstract V causes, according to the Short List (see the Annual Report for 1931, p. xxi.) are given for provinces, counties, and county boroughs, and in Abstract VI for urban and rural districts.

During the year 1933 the number of deaths recorded was 2,445 less than the number for 1932 and a comparison of the figures for the principal causes of death reveals the fact that the chief items which contributed to the decrease in question were senility, the deaths ascribed to which were 724 less than in 1932, bronchitis, a fall of 456 deaths, cerebral hæmorrhage a decrease of 301 deaths, tuberculosis of 166, measles of 125, and pneumonia of 115 deaths. On the other hand, an increase of 35 deaths was recorded from diphtheria, 136 from influenza and 97 from heart disease.

When compared with the average number of deaths for the decennial period ended with 1932 shown in the table on page xx the most striking features of the figures for 1933 are an increase of 152 in deaths from diphtheria, of 503 from influenza, of 185 from cancer, and of 939 from heart disease. The figures for tuberculosis, on the other hand, show a fall of 661, when compared with the average, those for bronchitis a decrease of 475 and the number ascribed to senility a decrease of 2,032 deaths. In the following pages further details regarding the principal causes of death are given and attention is drawn to the chief facts relating to mortality statistics.

Table H shows the proportion of deaths from the principal causes among the population as a whole and at certain age-periods. From this table it appears that heart disease is the cause of the largest proportion of deaths, namely, 154 in every 1,000 deaths; next in order are senility (146), all forms of tuberculosis (87), cancer (81), pneumonia (64), cerebral hæmorrhage, etc. (54) and bronchitis (53). These seven causes thus account for 64 per cent. of the total mortality.

Among infants under one year the group of diseases and conditions under the headings of congenital malformations and diseases of early infancy in Abstract IV (including debility and premature birth) is ascribed as the cause in 464 in every 1,000 deaths. Other fatal diseases at this age-period are diarrhœa and enteritis, pneumonia and bronchitis.

Epidemic diseases assume their greatest importance between the ages of one and 15. The preponderance of deaths from all forms of tuberculosis is evident between the ages of 15 and 35 years, and from that age cancer and heart disease exact the heaviest toll of life.

TABLE H.—Showing the relative frequency of Deaths at certain Age-periods from the principal Causes in 1933.

No.	CAUSES OF DEATH	PROPORTION PER 1,000 DEATHS AT EACH AGE-PERIOD

The statement below (extracted from Table 7a) shows the numbers of deaths from some of the principal causes in the year 1933, compared with 1932 and the average for the ten years, 1923-32:—

CAUSES	Number of Deaths registered			CAUSES	Number of Deaths registered		
	Years.		Average 10 years 1923-32		Years.		Average 10 years 1923-32
	1933	1932			1933	1932	
Typhoid Fever	75	82	100	Heart Disease	6,233	6,136	5,294
Typhus	3	8	9	Bronchitis	2,160	2,616	2,635
Measles	125	250	255	Pneumonia	2,576	2,691	2,505
Scarlet Fever	79	92	76	Diarrhoea and Enteritis under two years of age	563	581	571
Whooping-cough	289	294	367	Nephritis	1,149	1,223	1,180
Diphtheria	418	383	266	Puerperal Sepsis	80	78	92
Dysentery	3	8	Other Puerperal causes	175	178	185
Influenza	1,791	1,655	1,288	Congenital debility, mal- formation, premature birth, etc.,	1,767	1,776	1,797
Encephalitis Lethargica	32	32	42	Senility	5,902	6,626	7,934
Cerebro-Spinal Fever	17	17	17	Violence	1,017	977	950
Tuberculous Diseases	3,510	3,676	4,171				
Cancer	3,266	3,312	3,081				
Cerebral hæmorrhage, throm- bosis, hemiplegia, etc.	2,202	2,503	2,190				

The rates per 1,000 of the population represented by the deaths from the principal epidemic diseases* in the aggregate are shown in Table 16, which gives the information by provinces, counties and county boroughs; the rates in the county boroughs are the highest, that for Limerick county borough being 2·31; Waterford county borough, 1·31; Dublin City, 0·92; and Cork county borough, 0·85. The highest county rate is 0·72 for Kildare. The five lowest rates are those for the counties of Longford (0·08), Clare (0·12), Donegal (0·24), Meath (0·25), Tipperary, North Riding (0·35), and Mayo and Cavan (0·36).

Table 17 shows that the mortality rate from this group of causes for all urban areas (county boroughs and urban districts) was 0·91 per 1,000 of the population, compared with 0·35 for the rural districts.

Typhoid Fever.—There were 73 deaths from typhoid fever and 2 from paratyphoid fever, the total including 38 males and 37 females. The total is 7 less than in 1932, but 25 below the average for the ten years 1923-32. For the urban areas 17 deaths were recorded and 58 for the rural districts, equivalent to rates of 1·9 and 2·8 per 100,000, respectively. In 1932 the corresponding rates were 2·6 and 2·8, indicating a considerable fall in the figures for the urban areas.

Typhus.—A further decrease in deaths from typhus took place, the number, 3, being 5 below the number in 1932, and 6 below the average. Of the 3 deaths one was that of a male and 2 of females.

Small-Pox.—No death from small-pox has occurred since 1907, when one was registered.

Measles.—The number of deaths from this disease is exactly half that recorded for 1932. The total number for 1933 was 125 (62 males and 63 females). This number is 130 below the average for the ten years 1923-32. One hundred and nine of the deaths were those of children under 5 years of age, including 65 under 2 years. The urban mortality was 10·0 per 100,000 of the population as compared with 1·7 for the rural areas.

Scarlet Fever.—Deaths from scarlet fever numbered 79. This is 13 below the number in 1932, but 3 above the average for the preceding ten years. Of the 79 deaths, 33 were those of males and 46 of females.

Whooping-cough.—The number of deaths from whooping-cough was 289, compared with 294 for 1932 and an average of 367 for the preceding decennial period. All, except 16, of the 289 deaths were those of children under 5 years of age, 146 being those of infants under one year of age. The total number comprised 137 males and 152 females. The death-rates for urban and rural areas were 13·1 and 8·2 respectively.

Diphtheria.—Deaths from this disease numbered 418, equivalent to a rate of 14·0 per 100,000 of the estimated population, as compared with 383 in 1932 and an average of 266 for the ten years 1923-32. Of the 418 deaths, 180 were those of males and 238 of females, and 331 were of children under 10 years of age, or nearly 80 per cent. of the total number recorded.

The rate for urban areas is more than twice that for rural areas, the former being 22·8 and the latter 10·2 per 100,000 of the population. In 1932 the rates were 19·8 and 9·9, respectively.

The number of deaths from diphtheria by ages and sexes for counties and county boroughs and for urban and rural areas is shown in Abstracts IV to VI. From a comparison of the rates which these numbers yield for the counties and county boroughs, it is found that the highest

* Typhoid fever, typhus, small-pox, measles, scarlet fever, whooping-cough, diphtheria, dysentery, and diarrhoeal diseases.

rate occurred in Limerick county borough, viz., 96 per 100,000, followed by Carlow (35), Dublin county borough (26), Laoighis (25), Kildare (21), Cork county borough (20), and Galway (20). The lowest rates were in Waterford county (2), Sligo (3), Wexford (3), Tipperary county, North Riding (3), and each of Donegal and Meath (5).

The following statement gives the death-rates from this cause for aggregates of urban and rural districts for each year from 1901.

STATEMENT showing Death-rates from Diphtheria, per 100,000 of the estimated populations in Urban and Rural Districts of Saorstát Éireann during the years 1901 to 1933.

YEAR	Urban Districts	Rural Districts	YEAR	Urban Districts	Rural Districts
1901 ...	9.6	5.0	1918 ...	6.3	4.4
1902 ...	12.0	7.2	1919 ...	9.1	4.8

1915 ...	11.8	6.0	1932 ...	19.8	9.9
1916 ...	8.0	6.0	1933 ...	22.8	10.2
1917 ...	6.8	5.8			

In the following Diagram the trend of the mortality from this disease since 1911 is shown represented by the rates per 100,000 of the population of Saorstát Éireann, Northern Ireland, England and Wales, and Scotland.

Diagram No. 2: Deaths from Diphtheria, 1911 to 1933

Diarrhoea and Enteritis (children under 2 years).—The number of deaths of children attributed to these causes in 1933 was 563; this number is 18 less than the number in 1932 and 8 under the average for 1923-32, and is equal to a rate of 9·8 per 1,000 births registered.

The urban excess of mortality is specially marked under this heading, being 16·8 per 1,000 births as compared with 5·8 for rural areas: the rates for 1932 were 18·4 and 5·6.

Influenza.—During 1933 a further increase in the number of deaths from this disease took place. The total number was 1,791, which is 136 above the number for 1932, and 503 more than the average in 1923-32. As usual, deaths from this disease were most numerous in the first quarter of the year, viz., 64 per cent., followed by 22 per cent. in the second quarter, 5 per cent. in the third, and 9 per cent. in the fourth. The rate per 1,000 of the population represented by the number for the year was 0·60.

Of the 1,791 deaths, 806 were those of males and 985 of females.

The number of deaths for the rural areas was 1,376, as compared with 1,334 in 1932; the respective rates being 0·65 and 0·64 per 1,000 of the rural population. There was an increase in the deaths that appertained to urban areas, the number being 416, as compared with 321 for 1932, equivalent to rates of 0·47 and 0·36, respectively.

In 648 instances the deaths attributed to influenza were described as associated with respiratory complications, the remaining deaths (1,143) being returned as from influenza without qualification, or as complicated with maladies other than respiratory.

Erysipelas.—There were 38 deaths (21 of males and 17 of females) from erysipelas, as compared with 34 in 1932.

Encephalitis Lethargica.—The number of deaths recorded from this disease was 32, which is equal to the figure for 1932, and 10 less than the average during 1923-32; it is also less than the number in any year since 1923. Eighteen of the 32 deaths were of males and 14 of females.

Cerebro-spinal Fever.—This disease caused 17 deaths (11 of males and 6 of females). The number is equal to that for 1932 and also to the average for the 10 years 1923-32.

Tetanus.—The number of deaths from tetanus was 16, those of males being 12 and of females 4. In 1932 the numbers were 11, 6 and 5, respectively.

TUBERCULOSIS.

The number of deaths under this heading for 1933 shows a further decline, the figure having fallen to 3,510, a decrease of 166 when compared with 1932, and of 661 when compared with the average for the decennial period, 1923-32. The mortality from this disease is the lowest yet recorded and is equal to a rate of 1·17 per 1,000, as compared with 1·24 for the year 1932. The rate for England and Wales for 1933 was 0·82 per 1,000, for Scotland 0·80 and for Northern Ireland 1·15 per 1,000.

Table J. shows the mortality from this disease during the last eleven years. It will be seen that the rate in 1933 is 0·07 below that for 1932, and 0·23 below the average, and that between 1923 and 1932 the decrease was 17·7 per cent. Throughout the period shown, the death-rate for females has been in excess of that for males: in 1933 the rate for males was 1·16 and the rate for females 1·19 per 1,000 of the respective populations. This is the reverse of the order in Great Britain. In England and Wales the rates for males in 1933 was 0·97 per 1,000 and for females 0·69; and in Scotland 0·92 and 0·68 respectively.

TABLE J.—Showing, by sexes, the mortality from Tuberculosis in Saorstát Éireann during each of the years 1923-33.

YEAR.	MALES.		FEMALES.		TOTAL.		Annual Increase.		Annual Decrease.

* Decrease in 1932 as compared with 1923.

The number of deaths registered in 1933 for the urban districts was 1,451, as compared with 1,374 for the previous year. For the rural districts the number for 1933 was 2,059 and for the previous year 2,302. The rate per 1,000 of the population for the urban area increased from 1.55 to 1.63, while that for rural areas decreased from 1.10 to 0.98.

Deaths from pulmonary tuberculosis numbered 2,755, compared with 2,853 in 1932; and the respective numbers for these years from other forms of tuberculosis were 755 and 818. The deaths in 1933 included under the heading of other forms of tuberculosis are as follows:— Tuberculosis of the central nervous system, 272 (129 males and 143 females); tuberculosis of the intestines and peritoneum, 176 (84 males and 92 females); tuberculosis of the vertebral column, 67 (42 males and 25 females); tuberculosis of the bones and joints, 57 (38 males and 19 females); tuberculosis of other organs and parts, 32 (18 males and 14 females); and disseminated tuberculosis, 151 (74 males and 77 females).

Diagram No. 3 shows the rates of mortality from tuberculosis in Saorstát Éireann, Northern Ireland, England and Wales, and Scotland from 1911 to 1933. An almost continuous decline in the disease is evident. The curves for Saorstát Éireann and Northern Ireland differ but little, especially since 1926 and the proximity of the curve for England and Wales to that for Scotland is remarkable.

Diagram No. 3. Deaths from Tuberculosis 1911 to 1933.

The mortality from tuberculosis at different age-periods for each sex during the period 1912-14 and for each of the years 1930 to 1933 is shown in the following table. The great reduction in the rate at all age-periods and for each sex is apparent. A decrease in 1933 as compared with the period 1912-14 was 44 per cent. for all persons, 46 per cent. for males and 42 for females. As in preceding years, the greatest decrease has occurred at ages under 15, the rate under 5 years being 65 per cent. less than in 1912-14; at 5-10 years 63 per cent. less, and at 10-15, 61 per cent. less. At the age-periods 20-25 years and 25-35 years, where the rates (calculated on the estimated population at the respective age-periods) are the highest, the decrease is less apparent. At 20-25 years the fall is 26 per cent. and at 25-35 years 33 per cent.

In Diagram No. 4 the death-rate by sexes and age-periods for the year 1933 is shown, together with corresponding figures for the period 1912-14.

TABLE K.—Death-rates from Tuberculosis by sexes and ages per 1,000 of the population at same age during the period 1912-14, and during the years 1930 to 1933.

PERIODS	DEATH-RATES PER 1,000 OF THE POPULATION AT SAME AGE.

Diagram No. 4. Age-Mortality from Tuberculosis.

Abstracts V. and VI. give details regarding deaths from tuberculosis, for provinces, counties, county boroughs, and urban and rural districts, while Tables 15, 16 and 17 supply figures and rates per 1,000 of the population for these areas.

It will be seen from Table 16 that the highest mortality from tuberculosis for county or county borough areas was recorded for the following:—City of Dublin (1·80), Cork county borough (1·62), Louth (1·50), Dublin county (1·48), and Limerick county borough (1·42); the counties having the lowest rates being Cavan (0·73), Monaghan (0·78), Roscommon (0·80), Waterford (0·81), Meath (0·83) and Galway (0·91).

Syphilis, &c.—Eighteen deaths (9 of males and 9 of females) were ascribed to syphilis, this being equal to the number for 1932 and 15 less than the number for 1931. Eight of the deaths (3 males and 5 females) were those of infants under one year of age.

Six deaths (5 males and one female) were ascribed to gonococcal infection and other venereal diseases.

There were 22 deaths (19 of males and 3 of females) from general paralysis of the insane; 6 deaths (4 of males and 2 of females) from locomotor ataxy, and 20 deaths (of males 15, and of females 5) from aneurysm.

Purulent Infection, Septicæmia.—Under this heading 117 deaths were returned (65 being those of males, and 52 of females), as against 108 in the preceding year.

Other Infectious or Parasitic Diseases.—The remaining deaths included in the group of infectious and parasitic diseases include 5 (2 males and 3 females) from acute poliomyelitis, 2 (males) from anthrax, 7 (6 males and one female) from malaria, one (a male) from worms, 5 (3 males and 2 females) from mycoses, 2 (one male and one female) from mumps, 2 (one male and one female) from varicella, 2 (males) from trench fever and one (a female) from the effects of vaccination.

CANCER.

During the year under review the number of deaths attributed to cancer was 3,266. This figure shows a fall of 46 when compared with that for the preceding year but is 185 more than the average number for the decennial period, 1923–32. The total constitutes more than 8 per cent. of the total deaths recorded and is equal to a rate of 1·09 per 1,000 of the population. Of the total, 1,790 were deaths of males (or 1·17 per 1,000) and 1,476 were of females (or 1·00 per 1,000). When compared with corresponding figures for 1932 the male rate is unchanged, while the female rate shows a fall of 0·06 per 1,000 of the female population.

In Northern Ireland the rate for both sexes was 1·20, for males 1·12 and for females 1·28. In England and Wales the respective rates were 1·53, 1·49 and 1·56, and in Scotland 1·53, 1·47 and 1·59.

The trend of cancer mortality in these areas from the year 1911, is shown in the diagram on page xxviii.

Deaths from cancer in urban districts, where 1,079 deaths were registered, afford a rate of 1·23, and in rural districts, where 2,187 deaths were registered, a rate of 1·04. In 1932 the respective rates were 1·24 and 1·06.

Of the 3,266 deaths comprised under the description of cancer, 2,062 were returned as from carcinoma, 118 as from sarcoma, and 1,086 as from cancer, or malignant disease without specification.

Table (L.), pp. xxviii–ix, shows the deaths from cancer by sexes, ages, and parts affected, together with the rate per 100,000 living at certain age-periods. From 25 to 55 years of age the female rate exceeds in each instance the corresponding rate for males, but subsequently the rates for males are in excess, particularly at later periods of life. The female excess in middle life is due to the large proportion of deaths of women from cancer of the uterus and breast whereas the male excess in later life is attributable to cancer of the buccal cavity and the digestive organs.

Tumours—Deaths from tumours are classified under two headings: (1) those caused by tumours definitely described as non-malignant (No. 54 in the International List), and (2) those caused by tumours whose nature was not determined, or was not specified in the entry of the cause of death (No. 55). The deaths in 1933 in the first group numbered 69, and those in the second 91.

The 69 non-malignant tumours comprise 9, described as cerebral (6 of males and 3 of females); 22 of the ovary; 17 of the uterus; 7 of the bladder (3 males and 4 females); 2 (females) of the abdomen; 2 of the prostate; 2 (one male and one female) of the intestines; and one each of the following sites:—Axilla, breast, neck, stomach and pituitary body; and 3 of ill-defined or unstated site.

The 91 tumours of undetermined nature include 40 (22 of males and 18 of females) of the brain, 4 of the ovary, 2 of the prostate, 39 (16 males and 23 females) of other sites, and 6 of unstated or ill-defined site. The 39 other sites comprise 8 of the abdomen, 8 of intestine, 7 of mediastinum, 6 of stomach, and one of each of the following:—bladder, kidney, larynx, lumbar vertebrae, lung, spleen, testicle, tongue, uterus and pituitary body.

Rheumatism.—There were 105 deaths (49 of males and 56 of females) from rheumatic fever, 157 deaths (74 of males and 83 of females) from chronic rheumatism, and 101 (34 males and 67 females) from rheumatic arthritis and osteo-arthritis.

and Cancer, Malignant Disease.

Diagram No. 5. Deaths from Cancer 1911 to 1933

Diabetes.—The number of deaths from diabetes recorded was 251. Statistics of mortality from this disease in Saorstát Éireann are available from 1911 and are shown in Tables 6A, 7 and 7A. During the years 1911 to 1917 the average number of deaths was 257; in each of the years 1918 and 1919 the figure fell to 209, rising in 1920 to 235. The average number for the decennial period ended with 1930 was 227 and for the years 1931 and 1932 the number was 243 and 239 respectively.

In the year 1933 the rate per 100,000 of the population represented by the deaths from this disease was 8, compared with 10 in Northern Ireland, 16 in England and Wales and 14 in Scotland.

The mortality of females from this disease in Saorstát Éireann in 1933 is greater than that of males, the respective numbers being 131 and 120 and the rates 8.9 and 7.9 per 100,000. In England and Wales the female rate was 18.2 and the male 12.7, in Scotland 18 and 10 and in Northern Ireland 10.9 and 8.6 respectively.

Other General Diseases.—The remaining deaths in the group of general diseases include 3 (one male and 2 females) from scurvy, 15 (8 males and 7 females) from rickets, one (a female) from osteomalacia, 18 (one male and 17 females) from simple goitre, 45 (2 males and 43 females) from exophthalmic goitre, 10 (5 males and 5 females) from myxœdema, cretinism, 3 (males) from tetany, 3 (2 males and one female) from other diseases of the thyroid

and parathyroid glands, 2 (males) from diseases of the pituitary gland, 4 (males) from diseases of the thymus, 28 (16 of males and 12 of females) from diseases of the adrenals, 5 (3 males and 2 females) from toxæmia, 3 (2 males and one female) from acidosis, 3 (males) from amyloid disease, 2 (males) from hæmolytic jaundice, and one (female) from acholuric jaundice.

Anæmia.—Deaths from pernicious anæmia numbered 215, consisting of 92 deaths of males and 123 of females. The total number is 18 below that for 1932 and 19 above the figure for 1931.

The number of deaths from other anæmias was 111, those of males being 33 and those of females, 78. The number for 1932 was 107, males 38 and females 69.

Other Diseases of the Blood and Blood-forming Organs.—There were 32 deaths from purpura (16 males and 16 females); 6 (4 males and 2 females) from hæmophilia; 38 (17 males and 21 females) from leukæmia; 28 (21 males and 7 females) from aleukæmia (lymphadenoma, Hodgkin's disease); 4 (2 males and 2 females) from diseases of the spleen; and 3 (males) from polycythæmia.

Alcoholism.—Nine deaths were ascribed to alcoholism, all being of males. Cirrhosis of the liver caused 71 deaths, 48 being those of males and 23 of females. All except 2 females were over 35 years of age.

Meningitis and Encephalitis.—There were 266 deaths from meningitis (deaths of males numbering 137 and of females 129), as compared with 303, 172, and 131, respectively, in 1932.

The number of deaths described as from encephalitis (not returned as encephalitis lethargica) was 21, and as from cerebral abscess 14, compared with 24 and 11 respectively for the preceding year.

Cerebral Hæmorrhage, Hemiplegia, etc.—The number of deaths classified under this heading (No. 82 in the International List) has fallen from 2,503 in 1932 to 2,202 in 1933. The average for the 10 years 1923–32 was 2,190. Of the total, cerebral hæmorrhage caused 1,343 deaths (584 males and 759 females); cerebral thrombosis and embolism, 181 deaths (69 males and 112 females); cerebral softening, 21 deaths (9 males and 12 females); hemiplegia, 405 deaths (165 males and 240 females); and other paralysis of unstated origin, 252 deaths (113 males and 139 females).

Epilepsy.—There were 149 deaths (of males 87 and of females 62) from epilepsy. This number is 21 less than in the preceding year.

Convulsions (under 5 years of age).—The number of deaths ascribed to convulsions of children under 5 years of age was 369 (of males 222, and of females 147); of these 322, or 87.3 per cent., were those of infants under one year of age, constituting 8.6 per cent. of all deaths of infants during the year.

Heart Disease.—During the year under review, heart disease was the most frequent cause of death. The figure under this heading constitutes 15.4 per cent. of the mortality from all causes in 1933, and is equivalent to a rate of 20.8 per 1,000 of the population. The deaths registered from this cause numbered 6,233, which is 97 over that for 1932, and 939 above the average (5,294) for the ten years 1923–32.

Of the 6,233 deaths, 27 were ascribed to pericarditis, 74 to acute endocarditis, 1,608 to chronic endocarditis and valvular disease, 18 to acute myocarditis, 87 to fatty degeneration, 969 to chronic myocarditis and myocardial degeneration, 1,408 to unspecified myocardial disease, 247 to disease of the coronary arteries and angina pectoris, and in 1,795 instances the particular form of heart disease was unstated, or was other than those enumerated above.

Other Circulatory Diseases.—There were 628 deaths from the causes included in this group, 368 being those of males and 260 of females. This number is 29 above that in 1932, and 88 above the figure for 1931.

Of the diseases which comprise the group, arterio-sclerosis is the most numerous, causing 359 deaths; followed by gangrene, 114 deaths; idiopathic abnormalities of blood pressure, 80 deaths; other diseases of the arteries, 26 deaths; diseases of the veins, 22 deaths; aneurysm (referred to above), 20 deaths; diseases of the lymphatic system, 4 deaths; and other diseases of the circulatory system, 3 deaths.

Bronchitis.—Bronchitis caused 2,160 of the deaths registered (of males, 1,000, and of females, 1,160). This number constitutes 5.3 per cent. of the total deaths registered and is equal to a rate of 0.72 per 1,000 of the population. The total number is 456 below the number for 1932, and 475 below the average for the ten years 1923–32.

Pneumonia.—Deaths from pneumonia (all forms) amounted to 2,576, and afford a rate of 0.86 per 1,000 of the population; the total includes 1,137 from broncho-pneumonia, 378 from lobar pneumonia, and 1,061 from pneumonia (not otherwise defined); 1,473 of the total deaths were of males, and 1,103 of females.

The average number during the ten years 1923–32 was 2,505, and during 1932 the number recorded was 2,691.

Pleurisy; Empyema.—The number of deaths classed to empyema regarding which an originating cause could not be ascertained, was 22; the males numbering 14, and the females 8; and the deaths registered from other forms of pleurisy were 85, including 51 deaths of males and 34 of females.

Ulcer of the Stomach and Duodenum.—To this cause 304 deaths were attributed, 221 being those of males and 83 of females. The total number is 24 below the number in 1932, and 30 below the figure for 1931.

Appendicitis.—There were 204 deaths from appendicitis (of males 117, and of females 87). This number is 17 below that for 1932 but is 21 more than the figure recorded in 1931.

Cirrhosis of the Liver.—Deaths from this cause numbered 71 (males 48 and females 23), compared with 77 in 1932 and 89 in 1931.

Acute and Chronic Nephritis.—The number of deaths from acute nephritis (including nephritis not characterised as acute or chronic of persons under 10 years of age) was 185 (105 of males and 80 of females), from chronic nephritis 568 (304 of males and 264 of females), and from nephritis not described as either acute or chronic of persons over 10 years, 396 (217 males and 179 females), constituting a total of 1,149 deaths, which is 74 below the number for 1932, and 31 below the average for the ten years 1923–32.

PREGNANCY AND CHILDBIRTH.

The deaths of women during pregnancy and childbirth are classified under three headings, namely, (1) deaths from septic conditions, (2) deaths from accidents and diseases of pregnancy and childbirth, and (3) deaths not classed to pregnancy or childbirth but returned as associated therewith. To the first group 80 deaths were attributed in the year 1933, to the second, 175, and to the third, 41; so that altogether the deaths of childbearing women numbered 296. This number, which is 16 above that for the year 1932, represents a rate of 5.16 per 1,000 of the total births registered, as compared with 4.98 in the year 1932, and an average rate of 5.08 for the decade 1923–32.

From Table N it appears that the deaths actually classed to childbirth were one less than in 1932, puerperal septic diseases having increased by 2, and diseases and accidents of pregnancy and childbirth having decreased by 3.

In Tables 15 to 17 the number of deaths from sepsis and other puerperal conditions are given with the rates per 1,000 births represented thereby, by provinces, counties and county boroughs and groups of urban and rural areas.

TABLE M.—Showing the number of deaths of women in 1933 definitely returned as either caused by or associated with PREGNANCY or CHILDBEARING.*

VIOLENCE.

The number of deaths assigned to the group of violent or external causes (Group xvii., Abstract IV) during 1933 was 1,017. This is higher than in any year since 1923; it is 90 above the average for the five years 1928-32, and 40 above the number in 1932.

Deaths by suicide numbered 103, and by homicide, 13 (the term "homicide" is used to include infanticide), leaving 901 classed to other deaths by violence, the great majority of which were definitely stated to be accidental. The number of deaths by suicide are 7 less, and by homicide 3 less than the corresponding figures for last year.

Eighty of the suicidal cases were males and 23 females; in 18 cases poisoning was the means resorted to to cause death, lysol being used in 4 instances, carbon monoxide in 3, strychnine in 2, coal gas in one, and the following substances in the remaining 8 deaths: arsenic, aspirin, hydrocyanic acid, Jeyes' fluid, camphor and belladonna liniment, "corrosive acid," sheep dip, and "horse and cattle blister." In 28 instances suicide was caused by hanging or strangulation, in 22 by drowning, in 8 by firearms, in 22 by cutting or piercing instruments, in 4 by jumping from a height, and in one instance the means was not stated.

The 13 deaths by homicide comprise 10 of males and 3 of females: 6 of the males and 2 of the females were infants under one year of age.

There were 13 accidental deaths from poisons and poisonous gases; 3 of which were due to Jeyes' fluid, 3 to suffocation by smoke fumes, 2 by food poisoning, and in the other five instances death was occasioned by lysol, morphia, "Bromida," coal gas and carbon monoxide.

Burns and scalds caused 173 deaths (62 males and 111 females), of which 82 were those of children under 5 years of age.

Deaths from accidental drowning numbered 126 (107 of males and 19 of females).

An increase of 38 took place in deaths caused by vehicles. The total number was 236 (185 of males and 51 of females). Deaths from motor-driven vehicles increased to 149, the number the previous year having been 138; deaths from horse-drawn vehicles, and bicycles also show slight increases compared with last year, the numbers for the former vehicle being 35 in 1933 and 27 in 1932; and for the latter 16 and 13 respectively. Deaths by railway vehicles decreased from 17 in 1932 to 13 in 1933. Deaths attributed to tramcars numbered 3 last year. In 20 instances the motive power of the vehicles was not stated, being simply described as "lorry," "van" or "car."

The 149 deaths attributed to motor vehicles include 90 described as caused by "motors" or motor cars, 19 by motor lorries or vans, 21 by buses, 2 by fire engines, 11 by motor-cycles, and 6 by aeroplane accidents.

 AGES AT DEATH.

The deaths of 5,384 children under 5 years of age were registered during 1933. This number is 13.3 per cent. of the total deaths recorded. The proportion of deaths of males at this age-period exceeds that of females, the rate for males being 14.4 per cent. of the male mortality and the rate for females, 12.1 per cent. of the total number of deaths of females.

The deaths of persons aged 65 years and upwards numbered 18,502 constituting 45.6 per cent. of the total number of deaths, and include 9,028 deaths of males, or 43.8 per cent. of the total deaths of males, and 9,474 of females, or 47.5 per cent. of all the deaths of females.

Deaths at 70 years of age or over numbered 14,598, or 36.0 per cent. of the total deaths.

There were 164 deaths of persons aged 95 years or upwards (72 being males and 92 females), and those that were stated to have reached 100 years and upwards were 24 (10 males and 14 females). One man was stated to have reached 116 years.

The ages in detail of the persons whose deaths were registered in the year are given in Abstract III.

The following statement shows the variations in the death-rates at different age-periods between 1932 and 1933 :—

DEATH-RATES FOR EACH AGE-PERIOD PER 1,000 OF THE POPULATION AT THE SAME AGE.

AGE-PERIODS.	PERSONS.			MALES.			FEMALES.

All Ages ...	13.54	14.45	-0.91	13.52	14.40	-0.88	13.57	14.51	-0.94

In Table 8 are given the number of deaths by sexes and ages, and the average annual rates per 1,000 of the population at the same ages, during 1864-70, the decennial periods from 1871 to 1930, and each year from 1923 to 1933.

INFANT MORTALITY.

The deaths of 3,742 infants under one year of age were registered during 1933. This number is equivalent to a rate of 65 per 1,000 births, as compared with 72 in 1932, and an average of 70 for the ten years 1923-32. The rate for 1933 is the lowest yet recorded.

Of the total, 2,150 were those of males and 1,592 of females; the males were equal to a rate of 73 per 1,000 births of males, and the females to a rate of 57 per 1,000 births of females. The corresponding rates for 1932 were 79 and 65 respectively.

The infant mortality rate in Northern Ireland for 1933 was 80 per 1,000 births; in England and Wales, 64; and in Scotland, 81.

The following Diagram (No. 6) shows for each of these countries the infant mortality since 1911, as compared with Saorstát Éireann.

Diagram No. 6. Infant Mortality, 1911 to 1933

The most frequent causes of infant mortality in 1933 were congenital debility (equal to a rate of 14.38 per 1,000 births), premature birth (9.59), diarrhoea and enteritis (8.92), pneumonia (6.99), convulsions (5.61), congenital malformations (3.59), bronchitis (2.79), and whooping-cough (2.54). These causes in the aggregate were equivalent to 54.41 per 1,000 births, or 83 per cent. of the total infant mortality. (Table 10).

The deaths of infants during the first month of life were 39.7 per cent. of the total deaths of infants under one year of age. Between one and two months the percentage was 12.9; between 2 and 3 months, 9.2; at 3 and under 6 months, it was 18.2, and from 6 to 12 months old, it was 20.0.

Urban and Rural Infant Mortality.

The decrease in infant mortality recorded for 1933 occurred chiefly in urban areas, where the number of deaths of infants was 1,790, as compared with 1,977 in 1932, the respective rates being 85 and 95. In rural areas there was also a decrease, 1,952 infant deaths having been registered as against 2,083 the previous year; the rates per 1,000 births are respectively 54 and 59.

Table 11 shows the high rate of infant mortality which prevails in urban districts as compared with rural districts, more especially for urban areas of 10,000 inhabitants and upwards (Twelve Principal Towns); for these towns in the aggregate the rate is 87 per 1,000 births, as compared with 99 for the preceding year.

The rates for the individual towns are as follows, ranging from the highest to the lowest :— Limerick, 126 ; Wexford, 110 ; Waterford, 103 ; Kilkenny, 97 ; Sligo, 92 ; Cork, 89 ; Dun Laoghaire, 86 ; Galway, 86 ; Dublin, 83 ; Drogheda, 80 ; Dundalk, 60 ; and Tralee, 34.

Deaths of infants in urban districts of less than 10,000 inhabitants were equivalent to a rate of 79 per 1,000 births.

The infant mortality rate for Belfast in 1933 was 101 per 1,000 births ; for Londonderry it was 83 ; for London, 60 ; for Liverpool, 98 ; for Edinburgh, 66, and for Glasgow, 97 per 1,000 births.

The following statement shows the INFANT MORTALITY per 1,000 Births, by sexes, and at different periods of life in 1933 for the urban and rural areas in Saorstát Eireann.

AGES.	SAORSTAT EIREANN

Under one year ...	86·78	98·63	74·25	78·69	92·31	64·14	85·14	97·35	72·21	53·71	59·09	48·10

This table shows the very large proportion of infants who die before completing their first month of life. Thirty-seven per cent. of the infants who died in urban areas, and 42 per cent. of those in rural districts, were under one month old. This age-period is sub-divided in Table 12, and it will be seen from it that, of the total mortality rate for urban areas, 9·23 per 1,000 births, or 10·8 per cent., and for rural areas 6·77 per 1,000 births, or 12·6 per cent., were deaths of infants under one day old. This table also shows the contrast between the male and female mortality of infants ; in almost every instance the male mortality exceeds that of the females.

Deaths of Illegitimate Infants.

The number of deaths of illegitimate infants under one year of age registered during the year 1933 was 418, consisting of 228 deaths of males and 190 of females.

Table 13 shows the number of such deaths by causes and at different periods of life under one year of age. In Table 14 the deaths of illegitimate infants by counties and county boroughs, arranged according to the county of residence of the mothers, are shown. It will be observed that the great proportion of such deaths take place in institutions. Thus, of 30 deaths for Dublin county 24 took place in institutions, and of the 90 deaths for Dublin City, the number in institutions was 75, so that only 21 of the 120 deaths for Dublin county and city did not occur in institutions.

METEOROLOGY.

Particulars regarding meteorological observations taken at the Ordnance Survey Office, Phoenix Park, and at Roche's Point, Co. Cork, are published in the Quarterly Returns of Marriages, Births and Deaths. The following abstract of observations at Phoenix Park during the year is reproduced by permission of the Director of Ordnance Survey.

ABSTRACT OF METEOROLOGICAL OBSERVATIONS FOR THE YEAR 1933.
AT THE ORDNANCE SURVEY OFFICE, PHOENIX PARK, DUBLIN.

Latitude 53° 21' 48"·25 North. Longitude 6° 20' 59"·15 West. Height above M.S.L. 155·3 Feet.

The highest Barometer during the Year was 30·698 on February 11th, at 9 p.m. Wind—Calm.
The lowest " " 28·908 on March 17th, at 9 a.m. Wind—East.
The highest Temperature " " 81·4 on August 6th.
The lowest " " 21·0 on January 18th and 26th.

Rain or Snow fell on 179 days during the year.
The greatest Rainfall in 24 hours was 45·8 mms. on 24th February, with Wind East.
The prevailing Wind was W. on 105 days.
Calm 21 days.

NOTE.—The above populations, from 1801 to 1910, are derived from the estimated populations of Ireland, already published in previous Annual Reports, by applying to those populations the proportion borne by the Saorstát Éireann area, as disclosed at each Census. The variations between the proportions at each successive Census were distributed regularly over the intercensal periods.

The populations of Ireland were obtained as follows:—

From 1801 to 1831 by adopting the rates of increase of the male and female population between 1821 and 1831, as shown by the Irish Census Reports of 1831—the first complete Census of Ireland having been taken in 1821.

1832—1841.—By adopting the rate of increase between the population of 1831 and 1841, according to the Irish Census Report of 1841.

1842—1846.—By taking the English average birth-rate of 1 in 31, and death-rate of 1 in 45, and deducting the annual emigration from Ireland according to the returns received from the Emigration Commissioners in England.

1847—1851.—The English birth-rate, as above, was used, deducting the number of deaths and the number of emigrants in each year, as given in the Irish Census Reports of 1851. An allowance, proportioned to the number of recorded deaths and the number of emigrants being made in each year for the excess of the number thus arrived at for 1851 over the actual population according to the Census of that year.

1852—1871.—The English birth and death rates, as above, were used, deducting the number of emigrants, according to the returns obtained by the Registrar-General for Ireland, and allowing for excess over Census numbers for 1861 and 1871, as explained for the last period.

1872—1910.—By adding the births registered in each year to the estimated population for the previous year, deducting the deaths and the number of emigrants, and adjusting the results for the years 1872-81, 1882-91, 1892-1901, and 1902-1911, to allow for the discrepancy between the numbers thus arrived at for 1881, 1891, 1901 and 1911, respectively, and the population as shown by the Census in each of these years.

From 1911 to date, the populations were estimated by adding to the population of the area at the Census of 1911 the number of births registered, and deducting the number of deaths registered and the number of emigrants enumerated each year. From 1922 the migration figures have been used in the estimates, the number of emigrants and immigrants having been furnished by the Department of Industry and Commerce. Adjustments were made for the years 1915-1921 to cover the move-

* Figures for Tuberculosis (all forms) are not available by Urban and Rural Districts for the years 1901-5.

† For the year 1923 and subsequent years the births and deaths on which the above rates are based have been assigned to the normal residence of the mother in the case of births and to that of the deceased in the case of deaths. Prior to 1923 the figures on which the rates were based were partially corrected for deaths in institutions.

The rates given relate to the urban and rural areas as existing in the respective years.

‡ See note * on page 25

ABSTRACT 1.—(continued).

MARRIAGES, BIRTHS AND DEATHS, 1933.—Superintendent Registrars' Districts, by Counties.—LEINSTER.

[Wherever the minus sign (—) is prefixed to the numbers given in the column headed "Excess of Births over Deaths," it denotes that the births, instead of exceeding the deaths, were, in fact, less than the deaths to the extent stated.]

APPENDIX I.

ALTERATION IN REGISTRARS' DISTRICTS, 1933.

On the 1st January, 1933, the Registrar's District of Finglas and Glasnevin, in Dublin Superintendent Registrar's District, was divided into two Registrars' Districts, to be henceforth known as Finglas and Glasnevin No. 1 and Finglas and Glasnevin No. 2 respectively.

APPENDIX II.

Table showing the number of Searches made, number of Certificates issued, and the total amounts received as Fees for same at the General Register Office, Dublin, during the 70 years 1864-1933.

YEARS.	Number of Searches in the Registers.	Number of Certificates.	Amount received as Fees for Searches and Certificates.			YEARS.	Number of Searches in the Registers.	Number of Certificates.	Amount received as Fees for Searches and Certificates.
