GENERAL SUMMARY.

When compared with the figures for the preceding year the number of marriages recorded in 1936 shows an increase, the number of births a slight decrease, and the number of deaths a considerable increase.

Marriages.—The marriages registered in 1936 amounted to 14,763—a figure which is 427 in excess of that for the previous year, and 1,096 above the average number (13,667) for the ten years 1926 to 1935. For the years 1935 and 1936 the rates per 1,000 of the population were 4·83 and 4·98 respectively, compared with an annual average rate for the period 1926–35 of 4·63.

In Northern Ireland the marriage rate per 1,000 for 1936 was 7·15, in England and Wales, 8·65; and in Scotland, 7·63.

Births.—The number of births registered during the year 1936 was 58,115, a figure which is 151 less than the number recorded in 1935. The average annual number during the decennial period 1926–35 was 58,389. The rate for each of the years 1935 and 1936 was 19·61; for 1934 it was 19·49; and for the period 1926–35 the average rate was 19·78.

The rate in Northern Ireland for 1936 was 20·25, in England and Wales, 14·82, and in Scotland, 17·91.

There were 1,908 illegitimate births recorded, equivalent to 3·28 per cent. of the total births, as compared with 3·34 for 1935 and 3·51 for 1934. The corresponding percentage in Northern Ireland for the year 1936 was 4·63, in England and Wales, 4·11, and in Scotland, 6·46.

Deaths.—During the year 1936 the number of deaths registered was 42,586—this number is 1,043 in excess of the number for the preceding year. The rate per 1,000 of the population for the year 1936 was 14·37, compared with 13·98 for 1935 and 14·20 for the decennial period ended with the year 1935.

In Northern Ireland the death rate for 1936 was 14·40, in England and Wales, 12·14, and in Scotland, 13·44.

Of the deaths recorded, 17·9 per cent. were stated to be due to heart disease, 8·4 per cent. to cancer, 8·2 per cent. to tuberculosis (all forms), 5·9 per cent. to pneumonia, 5·6 per cent. to cerebral hæmorrhage and 5·2 per cent. to bronchitis.

The number of deaths registered as due to tuberculosis (all forms) amounted to 3,480. This figure, which is the lowest yet recorded, is 290 less than that for 1935 and 34 below that for 1934, and also 30 less than the figure for 1933. The rate per 1,000 of the population for 1936 was 1·17; for 1935 it was 1·27 and for the decennial period 1926–35 it was 1·31.

There were 3,573 deaths recorded from cancer (all forms)—this number is 50 more than the figure for 1935 and 168 more than that for 1934. The rates for the years 1934, 1935 and 1936 were respectively 1·15, 1·19 and 1·21 per 1,000 of the population.

During the year 1936 the number of deaths returned as due to diseases and accidents of pregnancy and childbirth was 273. This figure is equivalent to a rate of 4·70 per 1,000 births, compared with an average of 4·58 in the preceding ten years. The corresponding rate for urban areas was 3·99 per 1,000 births, and for rural areas, 5·14, as compared with 3·70 and 5·27 respectively, for the year 1935.

The number of deaths of infants under one year of age registered during the year 1936 was 4,309. This figure is 321 more than that for the year 1935, and is equivalent to a rate of 74 per 1,000 births, or 6 per thousand more than the corresponding rate for the previous year. The rates per 1,000 births for urban and rural areas were 99 and 59, respectively, in 1936; and 87 and 57 in 1935.

Among legitimate infants the rate of mortality was 66 per 1,000 births, and among illegitimate it was 305. The legitimate infant mortality rate for Northern Ireland was 73, and the illegitimate, 162; for England and Wales the corresponding rates were 57 and 88, and for Scotland 80 and 120 respectively.

The number of deaths registered as caused by violence was 1,023. This figure includes 98 due to suicide, 19 to homicide, 51 to violence (nature unknown), 5 to war wounds, and 850 to accidental causes. During the previous year there were 92 suicidal, 21 homicidal and 873 other violent deaths. The number of deaths registered during 1936 as attributable to road traffic was 228, compared with 225 for the previous year.

Issue of Authority for Registration.—Births and deaths which have not been registered within one year of their occurrence can only be registered on the authority of the Registrar-General. During 1936 authority was issued for the registration of 1,428 births and 280 deaths.

Vaccinations.—The number of successful primary vaccinations for the year 1936 as returned by the Registrars was 32,701, equivalent to 56 per cent. of the total births registered.

Searches and Certificates.—During the year 1936 the number of searches made in the registers of marriages, births and deaths in respect of which fees were received was 27,778, the certificates issued numbered 13,552, and the amount of fees received was £3,673. In the year 1935 the corresponding figures as follows:—Searches, 29,463; certificates, 13,024, and fees, £3,649.

TABLE A.—MARRIAGES, BIRTHS and DEATHS registered during each of the years 1926–36, with the rates per 1,000 of the estimated population represented thereby, and also particulars relating to Northern Ireland for the year 1936.

† According to the Census of 1937 (Preliminary Report).

MOVEMENT OF POPULATION.

It is estimated that the population of Saorstát Éireann at the middle of the year 1936 was 2,963,000. The number of males was estimated to be 1,520,000, and the number of females 1,443,000. These figures and the estimated population for each of the preceding ten years shown in Table I, page 2, are based on the result of the Census of 1926, the natural increase (excess of births over deaths), and the balance of the passenger movement (including emigration and immigration). The estimates thus arrived at for the years 1926 to 1935 have been revised in accordance with the population given in the Preliminary Report on the Census of 1936. The population (unrevised) according to the latter report was 2,965,854—males 1,518,807, and females 1,447,047.

In Table I, the estimated population for each of the years 1851 to 1936 is given.

Table B.—The average excess of births over deaths during the period 1864 to 1871, during each intercensal period between 1871 and 1926, and for each of the years 1927-1936, with the rates per 1,000 of the population, and the balance of the passenger movement by sea from 1927 to 1936.

Emigration and Immigration.—According to returns furnished by the Department of Industry and Commerce the numbers of emigrants to and immigrants from places out of Europe and not within the Mediterranean Sea during the year 1936 were 1,362 and 2,094 respectively, including 534 to and 1,470 from the United States—the corresponding figures for Canada being 63 and 96; for Australia 316 and 131; for New Zealand 23 and 33; for the Union of South Africa 99 and 56; for India 102 and 129; and for other countries 225 and 179 respectively. The immigrants to Saorstát Éireann from the areas specified outnumber the emigrants thereto, except in the case of Australia, the Union of South Africa and the countries grouped under the heading of "Other countries."

The following Table gives the number of emigrants and their destinations in 1936 as compared with the nine years preceding:—

TABLE C.—EMIGRANTS and IMMIGRANTS (of Saorstát Éireann and alien nationality) to and from places out of Europe and not within the Mediterranean Sea, together with the destinations of Emigrants during each of the years 1927-36.

YEAR	Number of Emigrants by Destinations								Number of Immigrants.

MARRIAGES.

Number and Rate.—During the year 1936 the number of marriages recorded was 14,763. This figure is 427 more than that for 1935 and is the highest on record since 1924, when 14,822 marriages were registered. The lowest figure recorded since 1924 was in the year 1932, when the number fell to 13,029. In 1933 the number recorded rose to 13,992, in 1934 to 14,251, in 1935 to 14,336, and in the year under review to 14,763. For each of the years in the quinquennial period ended with 1936 the marriages recorded represented the following rates per 1,000 of the estimated population respectively—4·42, 4·72, 4·80, 4·83 and 4·98. The rate for 1936 is 0·35 in excess of the average rate for the decennial period from 1926 to 1935 inclusive.

Modes of Celebration.—The number of marriages for the year 1936 celebrated in accordance with the rites and ceremonies of the Catholic church amounted to 13,834 (equal to 93·7 per cent. of the total), and other marriages numbered 929. The number of Catholic marriages is 380 more than that for 1935, and the number of all other marriages shows an increase of 47 when compared with the figure for the preceding year. In the year 1936 the number of marriages other than Catholic recorded include 660 celebrated according to the rites and ceremonies of the Protestant Episcopal Church; 134 in Presbyterian Meeting-houses; 59 in "Registered Buildings," belonging to various other religious denominations; 64 by civil contract in the Registrars' offices; 4 according to the usages of the Society of Friends, and 8 according to the Jewish rites. Comparing these figures with those for 1935, the number according to the rites and ceremonies of the Protestant Episcopal Church shows an increase of 24, in Presbyterian Meeting-houses an increase of 16; in "Registered Buildings" an increase of 12, and in the Registrars' offices a decrease of 8 marriages.

At the Census of 1926, Catholics represented 92·6 per cent. of the population, Protestant Episcopalians 5·5 per cent., Presbyterians 1·1, Methodists 0·4, and all other denominations 0·4.

The number of Catholic marriages recorded during 1936 is equal to a rate of 5·04 per 1,000 of the estimated Catholic population, a rate which is 0·37 above the average rate for the preceding ten years, and the rate for all other marriages was 4·24 per 1,000 of all persons other than Catholics in the population, or 0·09 above the average. Corresponding rates for each year from 1926 to 1935 are shown in Table D below. It must be borne in mind that these rates have been calculated on the proportion of Catholics and of persons other than Catholics in the population according to the Census of 1926.

TABLE D.—MARRIAGES registered in 1936, and in each of the previous ten years, according to the MODES OF CELEBRATION; with the rate per 1,000 of the population represented by Catholic and all other marriages.

YEARS	Marriages registered other than Catholic						Catholic Marriages	Total Marriages Registered	Rate per 1,000 of estimated corresponding Population represented by

Yearly Average 1926-35	634	123	57	74	2	11	906	12,761	13,667	4·67	4·15	4·63
1936 ...	660	134	59	64	4	8	929	13,834	14,763	5·04	4·24	4·98

Conjugal Condition.—In Abstract II, on pages 38 and 39, particulars regarding the marriages recorded by counties, and the conjugal condition of the parties married, etc., are given. The figures relating to conjugal condition show that marriages between bachelors and spinsters constitute 93·5 per cent. of the total marriages; those of widowers and spinsters, 4·2 per cent.; bachelors and widows, 1·4 per cent.; and those of widowers and widows, 0·9 per cent. Of the men married 5·1 per cent. were widowers, and of the women 2·3 per cent. were widows, or in 73 instances in every 1,000 marriages, one or both of the contracting parties had been married before. The corresponding figures for 1935 were:—widowers 5·0 per cent. and widows 2·4 per cent. In Table F similar figures from the year 1926 are shown.

TABLE E.—MARRIAGE-RATES (per 1,000 of the population) for counties, county boroughs and provinces, for the year 1936, together with comparative figures for the periods 1910 to 1912 and 1925 to 1927, inclusive.

Counties, &c.	Marriages per 1,000 of Population			Counties, &c.	Marriages per 1,000 of Population		
	Annual Average 1910-12	Annual Average 1925-7	Year 1936		Annual Average 1910-12	Annual Average 1925-7	Year 1936

Rates for Counties, etc.—In comparing the marriage-rates for the counties and county boroughs it must be borne in mind that the rates are based on the total number of marriages recorded in each area irrespective of the fact that some of the persons married may not be residents of the area in which the marriage took place. An examination of the actual returns of marriages proves that many persons living in the rural portions of the country are married in the county boroughs and urban areas. This fact accounts in some measure for the high rates for the county boroughs. In Limerick county borough the rate was 8.84 per 1,000; in Cork 8.66; in Dublin 7.75, and in Waterford 6.12. The rate for Dublin County (exclusive of the county borough) was 6.19 per 1,000. On the other hand the lowest rates for the year 1936 were recorded in Laoghis 2.96 per 1,000, Mayo 3.23, Offaly 3.57, Clare 3.59, and Cork (exclusive of the county borough) 3.64 per 1,000 of the population.

In the provinces the highest rate was 5.94 for Leinster, followed by 4.55 for Munster, 4.49 for Ulster (part of) and 3.77 for Connaught. The corresponding rates for 1935 were 5.70 for Leinster, 4.46 for Munster, 4.28 for Ulster (part of) and 3.78 for Connaught.

In Northern Ireland the rate for the year 1936 was 7.15, in England and Wales 8.65 and in Scotland 7.63 as compared with 4.98 for Saorstát Éireann. In the year 1935 the rates were:—Northern Ireland 6.87, England and Wales 8.60, Scotland 7.67, and Saorstát Éireann 4.83 per 1,000.

Marriages in each Quarter.—In Table 5 the number of marriages is shown by quarters for each of the years 1926-36, as well as the average rate for the ten years 1926-35 and for the year 1936. In the first quarter of 1936 the rate per 1,000 of the population was 5.1, in the second 4.6, in the third 5.6, and in the fourth 4.5. The corresponding figures for the year 1935 were 5.2 for the first quarter, 4.1 for the second, 5.6 for the third, and 4.4 for the fourth quarter.

In the same table the number of Catholic marriages and marriages other than Catholic for each quarter of the year is given, and the equivalent rate per 1,000 of the population compared with the average figures and rates for the decennial period from 1926 to 1935.

In the case of Catholic marriages, 26 per cent. were recorded in the first quarter, 23 per cent. in the second, 28 per cent. in the third, and 23 per cent. in the last quarter. For other marriages the percentages were 17, 27, 39, and 17 in the corresponding quarters of the year.

TABLE F.—Proportion of PERSONS NOT OF FULL AGE, and of RE-MARRIAGES during the years 1926 to 1936.

YEAR	Total Marriages	Persons not of Full Age		Re-Marriages	
		of 100 Men Married	of 100 Women Married	Widowers	Widows
				of 100 Men Married	of 100 Women Married
1926	13,570	1.50	6.53	6.33	3.21
1927	13,418	1.39	7.05	6.33	3.26
1928	13,716	1.58	7.35	6.37	3.40
1929	13,593	1.49	7.09	6.53	2.98
1930	13,651	1.91	7.41	6.68	3.23
1931	13,133	1.52	7.33	6.21	3.02
1932	13,029	1.73	7.71	5.73	2.87
1933	13,922	1.62	7.53	5.20	2.22
1934	14,251	1.82	7.82	5.20	2.61
1935	14,336	1.43	7.64	4.95	2.43
1936	14,763	1.35	7.00	5.05	2.30

Age at Marriage.—The Schedules to the Acts relating to marriages indicate that the law does not require that the ages of the contracting parties should be entered in the Register Book or Certificate. All that is necessary is that each party should be described as “of full age” or “minor” as the case may be, so that a complete record of the ages of the persons married is not available.

In the province of Leinster the proportion of husbands who married under age was highest, viz., 1.9 per cent., in Munster the percentage was 1.1, in Connaught 0.6, and in Ulster (part of) 0.5. In the case of females married the proportion who were minors in Leinster was 8.5, in Munster 5.5, in Connaught 4.0, and in Ulster (part of) 8.0. The corresponding percentages for Saorstát Eireann as a whole were 1.4 for husbands and 7.0 for wives.

The proportion per cent. of males married in Northern Ireland in 1936 who were under age was 2.6, and of females 12.1. In England and Wales for the year 1935, the proportions were 3.7 and 14.9, and in Scotland the corresponding figures were 5.1 and 18.5 respectively.

Licences for Marriage.—During the year 1936 the number of Licences issued by the Registrars for Marriages in Registered Buildings and in the Registrars' Offices was 107. On 31st December, 1936, the number of such Registrars of Marriages authorised to grant Licences for Marriages was 97.

Marriage Licences issued by Licensing Ministers of the Protestant Episcopal Church amounted to 587. The number of Licensing Ministers on the 31st December was 145.

The number of Licences for Marriage issued by the Licensing Ministers of the Presbyterian bodies in Saorstát Eireann during the year 1936 was 108, all of which were issued by Ministers of the General Assembly. The number of Licensing Ministers on the 31st December, 1936, was 49, of whom 47 were of the General Assembly and 2 of the United Presbytery or Synod of Munster.

Buildings in which Marriages may be solemnized.—The law does not require this office to keep a register of the churches and chapels of the Catholic Church in which marriages may be solemnized. In the case of the other religious denominations the records in this office show that 1,056 churches and chapels of the Protestant Episcopal Church were, on 31st December, 1936, licensed for the solemnisation of marriages, that 149 Presbyterian Meeting-houses (147 General Assembly and 2 United Presbytery or Synod of Munster), and 169 Separate Buildings belonging to various other religious denominations were registered for the solemnization of marriages. The several religious bodies to whom the 169 Separate Buildings belonged are shown in the following list:—

Denominations	No. of Places of Worship	Denominations	No. of Places of Worship
Methodists	129	Salvation Army	2
Reformed Presbyterians	5	Seceders	2
Baptists	8	“The Catholic Apostolic Church”	1
Independents or Congregationalists	6	Welsh Presbyterians	1
Christian Brethren	10	“Undenominational”	4
Moravians or United Brethren	1		
		TOTAL	169

BIRTHS.

Number and Rate.—The number of live births registered during the year 1936 was 58,115, a figure which is 151 less than the number recorded for the preceding year and 274 less than the annual average number registered during the decennial period 1926 to 1935. The number for 1936 is on the other hand higher than that for each of the years 1931 to 1934 inclusive, the average number for this period being 57,147.

The annual rate per 1,000 of the population represented by the number of births recorded during each of the years 1935 and 1936 was 19·61. In the years 1933 and 1934 the rates were 19·37 and 19·49 respectively.

In Tables 3 and 4 the number of births registered and the rate per 1,000 of the population represented thereby are given for the period 1864 (in which year the Act for the registration of births became effective) to 1870 and each decennial period from 1871 to 1930. In the first-named period the rate was 25·79 per 1,000 and in the period from 1871 to 1880 the annual average rate was 26·31 as compared with 20·21 for the decennial period 1921-30. A survey of the rates for the past ten years reveals the fact that during each of the first two years the rate exceeded 20 per 1,000 of the population. During the following years the rate was between 19 and 20, falling to 19·07 in 1932, the lowest rate yet recorded. The rate for 1935 and 1936 shows an increase of 0·54 when compared with that for the year 1932.

The following table shows the birth-rate for Saorstát Eireann, Northern Ireland, England and Wales, and Scotland for each of the years 1927 to 1936 :—

Years.	Saorstát Eireann.	Northern Ireland.	England and Wales.	Scotland.
1927	20·3	21·3	16·6	19·9
1928	20·1	20·8	16·7	20·0
1929	19·8	20·4	16·3	19·2
1930	19·9	20·8	16·3	19·6
1931	19·5	20·5	15·8	19·0
1932	19·1	19·9	15·3	18·6
1933	19·4	19·4	14·4	17·6
1934	19·5	19·8	14·8	18·0
1935	19·6	19·2	14·7	17·8
1936	19·6	20·2	14·8	17·9

Rates for Counties, etc.—The birth-rates for the provinces, counties, county boroughs and urban and rural areas are given in Tables 15 and 17. For the province of Leinster the rate was 21·30, for Munster 18·65, for Connaught 18·09, and for Ulster (part of) 18·15 as compared with 20·91, 19·27, 18·39 and 17·75, respectively, for 1935. An increase of 0·39 is shown in the rate for Leinster, and of 0·40 in that for Ulster (part of). The rate for Munster in 1936 has decreased by 0·62 and that for Connaught by 0·30 when compared with the rates for 1935.

A comparison of the figures in Table 15 discloses the fact that the rates were highest in the county borough areas, viz., Dublin, 24·51 per thousand; Limerick, 24·09; Cork, 23·70, and Waterford 23·57. The next highest rates were in Kildare county 22·15; Galway, 20·69; Louth, 20·30. On the other hand, the lowest rates were in Roscommon, 15·76; Sligo, 16·22; Cork county, 16·54; Longford, 16·58, and Leitrim, 16·98.

The birth-rates for the county boroughs and urban districts in the aggregate and for the rural districts when compared with the rates for the preceding year show that the urban rate has decreased by 0·32 per 1,000, being 23·11 as against 23·43 in 1935, while the corresponding rural rates were 17·90 and 17·79 respectively, an increase of 0·11. In Table 18 the birth-rates for the urban and rural areas are shown for a number of years.

Illegitimate Births.—The births registered during 1936 include 1,908 of illegitimate children, a figure which is 38 less than that for 1935. The number for 1936 is equivalent to a rate of 0·64 per 1,000 of the population and a rate of 3·28 per cent. of the total births recorded. The respective rates for the previous year were 0·65 per 1,000 and 3·34 per cent.

In Northern Ireland for 1936 the rate per cent. of the total births was 4·63, for England and Wales it was 4·11, and for Scotland 6·46.

The percentages, by provinces, are shown in the following statement for the years 1929-36:—

AREA	Illegitimate Births—per cent. of Total Births.							
	1929.	1930.	1931.	1932.	1933.	1934.	1935.	1936.
Saorstát Éireann	3·18	3·19	3·37	3·23	3·49	3·51	3·34	3·28
Leinster ...	3·64	3·85	3·86	3·73	4·15	3·87	3·60	3·45
Munster ...	3·37	3·13	3·39	3·26	3·33	3·54	3·58	3·38
Connnaught ...	1·56	1·46	1·63	1·55	1·90	2·06	1·75	2·02
Ulster (part of) ...	3·45	3·61	3·71	4·30	3·99	4·34	4·20	4·44

In Tables 15 and 17 the number of illegitimate births and the proportion per cent. of the total births registered for each of the provinces, counties and county boroughs are given for the year 1936. The highest percentages of the total births registered were in the following counties:—Kilkenny, 5·84; Wexford, 5·11; and Cavan, 5·04. The areas with the lowest rates were Cork county borough, 1·52; Mayo, 1·69; Roscommon, 1·72, and Leitrim, 1·85.

Legitimacy Act (1931).—The authority of the Registrar-General for the re-registration of births under the Legitimacy Act, 1931, was issued in 36 cases during the year 1936. The number of such cases for the preceding year was 30.

Proportion of Males to Females.—Births of males registered during 1936 numbered 29,602 and of females 28,513. The proportion between the sexes was 1,038 males to 1,000 females, a ratio which is 13 less than the average for 1926-35. In England and Wales for the year 1936 the proportion of males born alive to 1,000 females was 1,054, which was 7 more than the average for the ten preceding years, and in Scotland the proportion was 1,039, which was 9 less than the average for the decennial period ended with the year 1935. In Northern Ireland the proportion of male to every 1,000 female births for the year 1936 was 1,051.

Table 4 shows the proportion of male to female births in Saorstát Éireann for each of the years since 1926, and also the average rates since the year 1864.

The male children born in wedlock in 1936 numbered 28,624, and the female 27,583, or 1,038 males to every 1,000 females, and of the illegitimate children 978 were males and 930 females, or 1,052 boys to every 1,000 girls.

Births in each Quarter.—The total number of births by sexes registered during each quarter of 1936 is shown in the following table:—

	1st Quarter	2nd Quarter	3rd Quarter	4th Quarter	Total
Males	7,847	7,714	7,537	7,004	29,602
Females	7,087	7,886	7,380	6,660	28,513
TOTAL	14,434	15,100	14,917	13,664	58,115

The number of births registered in each quarter of the years 1926 to 1935 is shown in Table 5, and also the average figures for the period and the equivalent annual rate represented thereby, in comparison with the figures and rates for the year 1936. In the first quarter the rate for 1936 was 0·1 above the average, and in the other quarters the respective rates were 0·4, 0·1, and 0·2 below the average for the corresponding period of the preceding ten years.

Multiple Births.—The number of infants born alive in multiple births registered during 1936 was 1,320, consisting of 654 pairs of twins and 4 sets of triplets, as compared with 1,503 (741 pairs of twins and 7 sets of triplets) for the previous year. The twin children whose births were recorded during 1936 were 2·25 per cent. of the total number of infants whose births were registered, and the triplets 0·02. In 1935 these percentages were 2·54 and 0·04 respectively.

The number of mothers of living children whose births were registered during the year was 57,453. Of these, 56,795, or 98·85 per cent., gave birth to single infants, 654, or 1·14 per cent., to twins, and 4, or 0·01 per cent., to triplets.

The infants born in wedlock (56,207) included 54,927 single infants, 1,268 twins and 12 triplets, equivalent to, respectively, the ratios of 97·72 per cent., 2·26 per cent., and 0·02 per cent. to the total number of legitimate births.

Illegitimate infants included 1,868 single infants and 40 twin infants, equivalent, respectively, to 97·90 per cent. and 2·10 per cent. of the 1,908 illegitimate infants registered. In the year 1935 the illegitimate infants recorded included 1,903 single infants, 40 twin infants, and 3 triplet infants.

In the year 1936, the infants born alive in multiple births comprised 711 of males and 609 of females. Of the twin infants, 707 were males and 601 females and the triplet infants included 4 males and 8 females.

It should be noted that the figures given above relate to live births, as stillbirths are not registered, and that, therefore, the birth of one living child and one stillborn or one living child and two stillborn is counted as a single birth, and the birth of two living children and one stillborn is counted as a twin birth.

DEATHS.

Number and Rate.—The deaths of 42,586 persons were registered during the year 1936 ; of this number 21,920 were males and 20,666 females. The total number is 1,043 more than that recorded in 1935 and 3,503 in excess of that for 1934, in which year the figure was the lowest yet recorded. The deaths of males in 1935 were 1,621 more than in 1934, and in 1936 they exceeded by 379 the figure for 1935 ; in the case of females the deaths in 1935 increased by 839 and in 1936 by 664.

In 1936 the deaths registered represented a rate of 14·37 per 1,000 of the population, compared with 13·98 for 1935 and 13·15 for 1934. The rates for males during each of the past three years was 13·12, 14·17 and 14·42, the corresponding ratios for females being 13·19, 13·78 and 14·32 respectively.

A comparison of the death rates since 1864 is shown in Table 4, and in Table 8 the rates by sexes and ages for the same periods as in Table 4 are given.

In the following statement the death rate per 1,000 of the population for Saorstát Éireann, Northern Ireland, England and Wales, and Scotland for each of the years 1927 to 1936, is given.

Years.	Saorstát Éireann.	Northern Ireland.	England and Wales.	Scotland.
1927	14·8	14·6	12·3	13·6
1928	14·2	14·4	11·7	13·5
1929	14·6	15·9	13·4	14·7
1930	14·3	13·8	11·4	13·3
1931	14·6	14·4	12·3	13·3
1932	14·6	14·1	12·0	13·5
1933	13·7	14·3	12·3	13·2
1934	13·2	13·7	11·8	12·9
1935	14·0	14·4	11·7	13·2
1936	14·4	14·4	12·1	13·4

Rates for Counties, etc.—In Abstract I, pages 30 to 37, the number of deaths registered in each county, county borough and superintendent registrar's district is shown and also the number after correction for transfers to the place of residence of deceased. In Tables 15 and 17 rates based on the numbers so corrected are given for each of the provinces, counties and county boroughs and also for urban and rural areas. During the year 1936 the rates represented by the deaths recorded for the aggregate urban and rural areas were respectively 14·22 and 14·45 per 1,000 compared with 14·00 and 13·97 for the preceding year. The figure for the urban areas in 1936 is 0·22 above and that for the rural areas 0·48 above the respective rates for the year 1935. A comparative statement of the rates for these areas for a series of years is given in Table 18.

Standardised Rates.—Rates based on the number of deaths registered after correction as indicated represent the mortality in the population of a particular area, but a fair comparison between different areas cannot be made by such means. The incidence of mortality is affected by the age and sex constitution of the population, factors which vary in different localities. In order to make a comparison between the rates for various areas, it is necessary to reduce the mortality for such areas to a common basis providing a uniform age and sex constitution of population. This has been done by applying the death-rates for males and females in age-groups in the counties and county boroughs to a standard population adopted for the purpose. This process is known as the standardisation of death-rates ; it has been employed in these Reports for the last seven years, and a detailed description and example appeared in the Annual Report for 1930.

For the purpose of standardisation the population used is that of Saorstát Éireann according to the Census of 1926.

The effect of standardisation is shown in Table G. Rates calculated on the number of deaths for each county and county borough corrected in accordance with the system of transfer mentioned above are shown, and also the standardised rate for each area. In Col. 3 the difference between the corrected death-rate for each area and the standardised rate is shown.

An examination of this shows that the result of standardisation is to increase the rate for the county boroughs and to reduce the rate for purely rural areas. In the county borough of Dublin the rate is increased by 5·86, in Cork county borough by 3·90, in Limerick county borough by 4·48, and in Waterford county borough by 2·60.

TABLE G.—Death rates for Counties, County Boroughs and Provinces in 1936.

COUNTIES, ETC.	Death-rates in 1936 per 1,000 population.		
	Corrected for Transfers.	Standardised Rates.	Effect of Standardisation
	(1)	(2)	(3)
Carlow	14.59	14.82	— 0.27
Dublin	12.71	17.14	+ 4.43
City of Dublin	14.89	20.75	+ 5.86
Kildare	14.19	15.47	+ 1.28
Kilkenny	14.64	14.16	— 0.48
Laoighis	15.21	13.93	— 1.28
Longford	14.99	12.47	— 2.52
Louth	14.01	14.79	+ 0.78
Meath	15.28	14.97	— 0.31
Offaly	14.44	13.89	— 0.55
Westmeath	14.71	14.05	— 0.66

Saorstát Éireann	14.37	14.37	—

The following statement gives the average annual death-rates, by sexes, for the years 1925-7, compared with the crude rates for certain triennial periods at the time of each of the five preceding censuses, and affords an opportunity of showing the effect which the process of standardisation has upon the crude death-rates.

The triennial periods selected for comparison are those containing each of the years in which the census of population was taken, viz., 1871, 1881, 1891, 1901, 1911 and 1926. It may be assumed that the age and sex constitution of the population in each of these triennial

periods differed little from that enumerated in the Census figure for the central year of the period.

AVERAGE ANNUAL DEATH RATES—AS RECORDED (CRUDE) AND STANDARDISED—PER 1,000 OF POPULATION.											
	1870-2		1880-2		1890-2		1900-2		1910-2		1925-7
	Crude	Standardised	Crude	Standardised	Crude	Standardised	Crude	Standardised	Crude	Standardised	Death-rate
Persons	16.85	19.03	17.77	20.44	17.91	20.99	17.75	20.36	16.35	15.91	14.48
Males	17.33	19.44	18.10	20.75	17.83	21.06	17.85	20.38	16.32	16.35	14.33
Females	16.39	18.57	17.45	20.11	17.99	20.90	17.65	20.31	16.37	15.49	14.63

From this statement it appears that the decrease which has taken place in the death-rate in recent years is much greater than appears from a comparison of crude rates. The decrease between the rates for 1870-2 and 1925-7 is 2.37 per 1,000 when the crude rates are compared, but when the standardised rates for the periods are compared the difference is 4.55 per 1,000.

Similar differences are shown for the other periods except 1910-12; for that period the death-rate for all persons is reduced by standardisation. This is due to the fact that the report on the Census taken in 1911 showed a high proportion of aged persons.

Deaths in each Quarter.—The following statement shows the number of deaths of persons and of males and females registered during each quarter of the year 1936.

	1st Quarter	2nd Quarter	3rd Quarter	4th Quarter	Total.
Males ...	6,662	5,504	4,515	5,239	21,920
Females ...	6,211	5,317	4,137	5,001	20,666
TOTAL ...	12,873	10,821	8,652	10,240	42,586

Of the total deaths 23,694, or 55.6 per cent., were registered during the first six months, and 18,892, or 44.4 per cent., in the second six months. The corresponding percentages for the preceding year were respectively 53.8 and 46.2.

During the year 1936 the mortality was highest in the first quarter, in which the rate was 17.4 per 1,000 of the population. In the second quarter the rate was 14.6, in the third 11.7, and in the last quarter it was 13.8. In the preceding year the rates for the quarters were as follows:—first 15.3, second 14.7, third 11.8, and fourth 14.0. The rate for the first quarter of 1936 shows an increase of 2.1 when compared with that for the first quarter of 1935.

The rates for each quarter of 1936, and the average figures for the preceding ten years, are given in Table 5. A comparison between the rates for 1936 and the average figure shows that in the first quarter there was an increase of 0.2 per 1,000, and in the second a decrease of 0.1 per 1,000. In the third quarter the rate is 0.1 above the average, and in the fourth quarter the rate for the year 1936 exceeds the average by 0.5 per 1,000.

Deaths in Institutions.—In Abstract V information is given relating to deaths in institutions, for the country as a whole, and for each province, county and county borough. Deaths occurring in general and special hospitals numbered 5,010, in mental hospitals, 1,040, and in county homes and hospitals, etc., 7,516; and 29,020 occurred elsewhere, chiefly at the homes of the deceased. These figures are in the respective proportions of 11.8, 2.4, 17.7 and 68.1 per cent. of the total number of deaths.

These rates, when compared with the figures for earlier years, indicate an increasing tendency to avail of hospital and institution treatment. In 1926 the percentages of deaths in the three classes of institution were 8.0, 2.7, and 14.6, respectively, 74.7 per cent. dying at their own homes.

Uncertified Causes.—The number of cases in which the cause of death was not stated to have been certified by a medical practitioner or coroner was 7,557. This figure is equivalent to a rate of 17·7 per cent. of the total deaths registered during the year. The proportion for the previous year was 17·2 and the average percentage for the ten years from 1926 to 1935 was 21·3.

The majority of the uncertified deaths are recorded in rural districts, the percentage for these districts in 1936 being 25·2. In the urban areas the percentage was only 2·1.

Inquests.—The number of deaths registered on certificates issued by coroners as the result of inquests or post-mortem examinations during the year 1936 was 1,292, or one in every 33 deaths registered, compared with one inquest in every 35 deaths in 1935. The number of such deaths for the year 1936 include 964 cases in which inquests were held and 328 cases in which death was registered on a certificate of the result of a post-mortem examination.

CAUSES OF DEATH.

In Abstract IV the causes of deaths of males and females registered in Saorstát Eireann during 1936 are tabulated by the age at death in accordance with the Intermediate and Detailed International Lists. In Abstract V the causes of death classified in accordance with the Short List (see Annual Report for 1931, p. xxi) are given by sexes and age-periods for the provinces, counties, and county boroughs, and in Abstract VI information regarding the causes of death is shown for each of the urban and rural districts.

The number of deaths recorded during the year 1936 was 1,043 more than that for the preceding year. When the numbers of deaths from the chief causes for each of the years 1935 and 1936 are compared, it appears that increases as stated were shown in the following :—heart disease, an increase of 600 deaths; senility, an increase of 345; diseases of early infancy and congenital malformations, an increase of 179; cerebral hæmorrhage, etc., an increase of 109, and whooping-cough of 104. On the other hand a decrease of 290 is shown in the number of deaths registered as due to tuberculosis (all forms), and 280 in the number from influenza.

A table on page xx shows the deaths from each of the principal causes for the years 1935 and 1936 compared with the average number of deaths recorded during the decennial period ended with 1935. When compared with the averages for this period, the number of deaths during 1936 ascribed to senility shows a decrease of 787; influenza of 562; tuberculosis (all forms) of 398, and bronchitis of 196 deaths. The number of deaths registered as due to cancer (all forms) increased by 316, and an increase of 1,788 is shown in the deaths returned as being caused by one or other forms of heart disease. In the following pages further details regarding the principal causes of death are given and particular attention is drawn to the outstanding features of the mortality statistics.

In Table H the proportion of deaths from the principal causes at certain age-periods is given. From this table it appears that heart disease is the cause of the largest proportion of deaths, namely, 179 in every 1,000 deaths; next in order come senility (146), cancer (84), all forms of tuberculosis (82), pneumonia (59), cerebral hæmorrhage, etc. (56) and bronchitis (52). These causes account for 66 per cent. of the total mortality.

Among deaths of infants under one year the group of diseases and conditions under the heading of congenital malformations and diseases of early infancy in Abstract IV (including debility and premature birth) accounts for 460 in every 1,000 deaths compared with 453 in every 1,000 deaths for the preceding year. Other fatal diseases at this age-period are diarrhœa and enteritis, pneumonia, bronchitis and whooping-cough.

In the case of children between the ages of one and 5 years the excess in the mortality from measles, scarlet fever, whooping-cough, diphtheria, tuberculous disease (other than that of the respiratory organs), and pneumonia is apparent. The chief feature of the mortality of children aged 5 and under 15 years of age are the proportion due to diphtheria, tuberculous disease (all forms) and pneumonia. The cause of the majority of the deaths of persons aged 15 and under 45 years is tuberculous disease, and subsequent to that age the chief factors in the mortality are cancer, cerebral hæmorrhage, heart disease, bronchitis and pneumonia.

TABLE H.—Proportion of Deaths from the principal Causes at certain age-periods, 1936.

No.	CAUSES OF DEATH	PROPORTION PER 1,000 DEATHS AT EACH AGE-PERIOD

In the following statement the number of deaths from each of the principal causes recorded for each of the years 1935 and 1936 is given and also the annual average number for the decennial period 1926-1935.

CAUSES	Number of Deaths registered			CAUSES	Number of Deaths registered		
	Years.		Average 10 years 1926-35		Years.		Average 10 years 1926-35
	1936	1935			1936	1935

Encephalitis Lethargica	22	27	38	Senility	6,220	5,875	7,007
Cerebro-Spinal Fever	41	29	18	Violence	1,023	991	935
Tuberculous Diseases	3,480	3,770	3,878				
Cancer	3,573	3,523	3,257				
Cerebral hæmorrhage, thrombosis, hemiplegia, etc.	2,382	2,273	2,255				

The rates per 1,000 of the population represented by the deaths from the principal epidemic diseases* are given by provinces, counties and county boroughs in Table 15. The rates for the county boroughs are as follows:—Limerick 1·30; Dublin 1·24; Waterford 1·04; and Cork 0·92 per 1,000. The highest county rates are Tipperary, South Riding, 0·70; Dublin 0·58, and Carlow and Kildare each 0·55 per 1,000. The counties in which the rates are lowest are Meath 0·20, Leitrim 0·24, Roscommon 0·25, Westmeath 0·27, Waterford and Mayo 0·28, Cork 0·29 and Clare 0·30 per 1,000 of the population.

It may be seen in Table 17 that the mortality from this group of causes for all urban areas (county boroughs and urban districts) was equal to a rate of 0·99 per 1,000 of the population, compared with 0·37 for the rural districts. The corresponding rates for 1935 were 0·91 and 0·39 respectively.

Typhoid and Paratyphoid Fevers.—Sixty-three deaths (38 of males and 25 of females) were registered during the year 1936. The figure for the preceding year was 64, and the average for the ten years ended with 1935 was 85. Of the deaths for 1936, 20 were recorded for urban areas and 43 for rural areas compared with 12 and 52 respectively for 1935.

Typhus.—The number of deaths registered during each of the years 1935 and 1936 was 2, and the average for the years 1926 to 1935 was 7.

Small-pox.—No deaths from this disease have been registered since the year 1907 when one death was recorded.

Measles.—This disease was the cause of 231 deaths in the year under review: This figure is 85 less than that for 1935 and 16 below the average. The deaths for 1936 include 126 for urban districts and 105 for rural areas; for 1935 the numbers were respectively 180 and 136. Of the total for 1936 the deaths of males were 106 and of females 125. Fifty-four deaths were of infants under one year and 135 were of children aged one and under five years.

Scarlet Fever.—The deaths recorded numbered 173. This figure, which is 81 more than that for 1935 and 91 above the average, is the highest since 1916, when the number was 184. The number for 1936 includes 18 of infants under one year of age, 77 of children between the ages of one and five years, and 35 aged 5 and under 10 years.

Of the total deaths 66 were registered for Dublin county borough, 21 for Donegal county, and 10 for each of the counties of Wexford, Mayo and Cavan.

*Typhoid fever, typhus, small-pox, measles, scarlet fever, whooping-cough, diphtheria, dysentery, and diarrhoeal diseases.

Whooping-cough.—This disease caused 229 deaths, a figure which exceeds that for the previous year by 104, but which is 57 less than the average for the decennial period from 1926 to 1935. The figure for 1936 includes 91 of males and 138 of females, showing increases of 24 and 80 respectively when compared with the corresponding numbers for 1935.

Fifty-four of the deaths recorded were of residents of Dublin county borough, 20 belonged to Limerick county borough, 17 to Galway county, 15 to Donegal and 10 to each of Kildare, Laoighis and Limerick counties.

Diphtheria.—There was a fall of 33 in the number of deaths recorded for 1936, the figure being 345 as compared with 378 for 1935. The numbers registered during each of the years 1932, 1933 and 1934 were, respectively, 383, 418 and 341, and the average figure for the decennial period prior to the year under review was 317. The number for 1936 includes 156 of children under 5 years of age and 159 of children over 5 and under 15 years of age.

The number of deaths from diphtheria is equivalent to a rate of 11·6 per 100,000 of the estimated population, the respective rates for the urban and rural areas being 17·2 and 9·0. The corresponding rates for 1935 were 12·7 for the whole country, 18·1 for the aggregate urban areas and 10·2 for the rural districts. In Leinster the rate was 16·6, in Munster 8·9, in Connaught 8·0, and in Ulster (part of) 5·7. The corresponding rates for the year 1935 were as follows :—Leinster 17·5 ; Munster 11·2 ; Connaught 9·1 ; and Ulster (part of) 4·3 per 100,000 of the population.

The number of deaths from this disease for each of the counties and county boroughs and for urban and rural areas is given in Abstracts V and VI. The following are the counties and county boroughs in which the highest and lowest rates per 100,000 of the population represented by the deaths from diphtheria were recorded during the year 1936 :—highest rates—Kildare county 27·7, Laoighis county 26·0, Limerick county borough 24·2, Dublin county borough 23·1, Wexford county 17·0, Tipperary, S.R., 15·3. The lowest rates were in Meath county 1·6, Kerry county 2·1, Donegal county 2·8, Sligo county, 3·0, Waterford county borough 3·6, Louth county 4·7.

The death-rates per 100,000 for the aggregate urban and rural districts for each year from 1901 are shown in the following statement :—

YEAR	Urban Districts	Rural Districts	YEAR	Urban Districts	Rural Districts
1901 ...	9·6	5·0	1919 ...	9·1	4·8
1902 ...	12·0	7·2	1920 ...	18·6	5·3
1903 ...	9·5	7·2	1921 ...	21·3	12·5
1904 ...	5·9	6·5	1922 ...	15·7	12·3
1905 ...	7·1	6·2	1923 ...	10·4	9·1
1906 ...	8·2	7·2	1924 ...	8·8	5·1
1907 ...	9·9	4·4	1925 ...	7·7	4·3
1908 ...	10·3	6·1	1926 ...	11·8	4·5
1909 ...	11·2	8·0	1927 ...	13·5	4·8
1910 ...	10·7	6·3	1928 ...	11·8	5·8
1911 ...	17·0	5·3	1929 ...	16·0	7·9
1912 ...	15·9	5·0	1930 ...	22·2	9·2

1914 ...	12·7	4·3	1932 ...	19·1	10·2
1915 ...	11·8	6·0	1933 ...	21·7	10·6
1916 ...	8·0	6·0	1934 ...	18·1	8·4
1917 ...	6·8	5·8	1935 ...	18·1	10·2
1918 ...	6·3	4·4	1936 ...	17·2	9·0

In the diagram on the following page the trend of the mortality from diphtheria is shown by a comparison of rates per 100,000 of the population for Saorstát Éireann, Northern Ireland, England and Wales and Scotland.

DIAGRAM No. 2. Mortality from Diphtheria, 1922 to 1936.

Diarrhoea and Enteritis.—During the year 1936 the number of deaths of children under 2 years of age from this cause recorded was 648 (of males 374 and of females 274); this number which is 42 less than that for the year 1935 but 71 above the average for the years 1926 to 1935, is equal to a rate of 11.2 per 1,000 births registered.

The urban mortality in 1936 was equivalent to a rate of 19.7 per 1,000 births, compare with 5.9 for rural areas; the corresponding rates for the previous year were 19.8 and 6. respectively.

Influenza.—There were 683 deaths registered during the year 1936. This figure is 28 less than the figure (963) for 1935 and is also 562 below the average number (1,245) for the ten years ended with 1935.

The mortality in 1936 was highest during the first quarter, being equivalent to 41 per cent. of the total; in the second quarter the proportion was 29 per cent.; in the fourth quarter it was 21, and in the third 9 per cent.

The death-rate per 1,000 of the population from this disease for 1936 was 0.23; the rates for the aggregate urban and rural areas being respectively 0.12 and 0.28. The corresponding rates for 1935 were 0.32, 0.38 and 0.29 per 1,000.

The number of deaths for each of the counties and county boroughs and for the urban and rural districts is given in Abstracts V and VI.

The deaths attributed to influenza were described in 194 instances as associated with respiratory complications, and in the remaining cases—489 in number—the cause was given as influenza either without qualification, or complicated by diseases other than those of respiratory organs.

Erysipelas.—Deaths from this cause numbered 54 (24 males and 30 females), as compared with a total of 47 in the previous year.

Encephalitis Lethargica.—The number of deaths recorded from this disease was 22, which is 5 less than the figure for 1935, and 16 less than the average for the period 1926-35. Of the deaths 10 were of males and 12 of females.

Cerebro-spinal Fever.—This disease caused 41 deaths (21 of males and 20 of females). The number for 1935 was 29 and the average for the 10 years 1926-35 was 18.

Tetanus.—There were 12 deaths from tetanus, 8 being of males and 4 of females. The figures for the year 1935 were 27, 18 and 9 respectively.

Tuberculosis.—The number of deaths recorded from all forms of this disease during the year 1936 was 3,480. This figure is the lowest yet recorded and shows a substantial fall (equivalent to 7.7 per cent.) when compared with the figure for the preceding year (3,770) and also a decline of 398 below the average number for the period from 1926 to 1935. The rate per 1,000 of the population represented by the number of deaths registered in 1936 was 1.17; for the year 1935 it was 1.27 and for the decennial period from 1926 to 1935 it was 1.31 per 1,000.

In England and Wales the rate for 1936 was 0.69 per 1,000, for Scotland it was 0.74, and for Northern Ireland 1.03. The figures for 1935 for these areas were respectively 0.72, 0.74, and 1.05 per 1,000.

The mortality during the last eleven years is shown in Table J. An interesting comparison is made between the death rates for males and females during the period. Up to and including the year 1934 the rate for females exceeded that for males, but in the years 1935 and 1936 the male rate was slightly in excess, the figures for the latter year being 1.18 and 1.17 respectively. In Northern Ireland the rate for males in 1936 was 1.02, and for females 1.03 per 1,000; in England and Wales 0.83 and 0.57; and in Scotland 0.83 and 0.65, respectively.

TABLE J.—Mortality from Tuberculosis in Saorstát Eireann during each of the years 1926-36.

Average, 1926-35 ...	1,940	1.29	1,938	1.34	3,878	1.31	—	—
1936	1,791	1.18	1,689	1.17	3,480	1.17	— 290	— 7.7

The number of deaths from tuberculosis of the respiratory system recorded during 1936 numbered 2,724, compared with 2,976 in 1935; and the respective numbers for these years from other forms of tuberculosis were 756 and 794. The deaths classified under the heading of other forms of tuberculosis include:—Tuberculosis of the central nervous system, 260 (138 and 122 females); tuberculosis of the intestines and peritoneum, 148 (75 males and 73 females); tuberculosis of the vertebral column, 76 (49 males and 27 females); tuberculosis of the bones and joints, 62 (45 males and 17 females); tuberculosis of other organs and parts, 57 (27 males and 30 females); and disseminated tuberculosis, 153 (88 males and 65 females).

In the following diagram the mortality from tuberculosis for Saorstát Éireann, Northern Ireland, England and Wales, and Scotland from 1922 to 1936 is compared. An almost continuous decline in the disease is evident. It is noticeable that the lines for Saorstát Éireann and Northern Ireland follow a similar course, and the proximity of the curve for England and Wales to that for Scotland is remarkable.

DIAGRAM No. 3. Mortality from Tuberculosis 1922 to 1936.

The death-rate from tuberculosis at different age-periods by sexes during each of the years 1931 to 1936 is shown in the table on the next page. The rate for 1936 at each age period when compared with that for 1931 shows a reduction with the exception of the rates for the three highest age-periods.

At the age of 15 and under 20 years the death rate from tuberculosis for both sexes has fallen by 0.43—in the case of males by 0.35 and females by 0.52. At the next age group (where the mortality rate is highest) the fall for persons is 0.06—males 0.05 and females 0.06. In the case of persons aged 25 and under 35 years the fall in the rate is 0.26; for males 0.23 and for females 0.29 per 1,000.

TABLE K.—Death-rates from Tuberculosis by sexes and ages per 1,000 of the population at same age during each of the years 1931 to 1936.

PERIODS	DEATH-RATES PER 1,000 OF THE POPULATION AT SAME AGE.

In Abstracts V and VI particulars of the deaths from tuberculosis for each of the provinces, counties, county boroughs, and urban and rural districts are shown, while in Tables 14 to 17 the number of deaths and rates per 1,000 of the population represented thereby are given for these areas.

In Leinster the rate was 1.38, in Munster 1.12, in Connaught 0.92, and in Ulster (part of) 0.89. In 1935 the corresponding rates were Leinster 1.41, Munster 1.26, Connaught 1.12, and Ulster (part of) 0.99.

The highest mortality rates from tuberculosis for county or county borough areas were recorded for the following:—Dublin county borough 1.59; Waterford county borough 1.57; Meath county 1.50; Wexford county 1.44; Dublin county 1.42; and Limerick county borough 1.40. The counties having the lowest rates were Cavan 0.64, Roscommon 0.70, Mayo 0.76, Longford 0.85, Limerick 0.87 and Clare 0.97 per 1,000.

The deaths registered in 1936 from tuberculosis for the aggregate urban districts numbered 1,434, as compared with 1,554 for the previous year. For the rural districts the number for 1936 was 2,046 and for the previous year 2,216. The rate per 1,000 of the population for the urban areas fell from 1.62 in 1935 to 1.49 in 1936, and that for the rural areas from 1.10 to 1.02 per 1,000 of the population.

Syphilis, etc.—There were 18 deaths registered in which the cause of death was given as syphilis. Of this number 13 were of males and 5 of females. The corresponding figures for 1935 were:—Persons 16, males 11 and females 5. Twelve of the number recorded during 1936 were of infants under one year of age.

The deaths from gonococcal infection and other venereal diseases numbered 3 (males). The number of deaths ascribed to general paralysis of the insane was 21 (males); to locomotor ataxy 3 (males), and to aneurysm 29 (males 21 and females 8).

Purulent Infection, Septicaemia.—There were 132 deaths (73 males and 59 females) registered in 1936 as compared with 129 (76 males and 53 females) in the preceding year.

Other Infectious or Parasitic Diseases.—The remaining deaths included under the heading of infectious and parasitic diseases include 2 (females) from dysentery, 8 (3 males and 5 females) from acute poliomyelitis, 2 (males) from anthrax, 2 (males) from malaria, 3 (males) from other diseases due to protozoa, 2 (one male and one female) from other diseases, due to helminths, 3 (2 males and one female) from mycoses, 4 (one male and three females) from parotitis, one (female) from mumps, one (male) from chicken-pox, and one (male) from post-vaccinal encephalitis.

Cancer.—The deaths ascribed to cancer (all forms) during the year 1936 numbered 3,573, a figure which is 50 more than that for 1935 and 316 over the average for the decennial period 1926 to 1935. The number of deaths of males was 1,964 and of females 1,609. The figure for males is 61 more and that for females 11 less than the corresponding figure for 1935.

The deaths from this disease constitute 8·4 per cent. of the deaths from all causes and are equivalent to a rate of 1·21 per 1,000 of the population. The rates for males and females were respectively 1·29 and 1·12 per 1,000. In 1935 the rate for persons was 1·19; for males 1·25 and for females 1·12 per 1,000. In Northern Ireland in 1936 the respective rates were 1·30, 1·23 and 1·36 per 1,000. For England and Wales the rates were 1·63, 1·61 and 1·64, and for Scotland 1·59 for both sexes, 1·55 for males and 1·63 for females. In the diagram on the next page the rate of mortality from this disease for the past fifteen years is shown.

In the following statement the number of deaths registered from carcinoma, sarcoma and cancer or malignant disease (not otherwise defined) in Saorstát Éireann during each of the five years from 1932 to 1936 is given.

Deaths from	1932.	1933.	1934.	1935.	1936.
Carcinoma	2,002	2,062	2,162	2,296	2,526
Sarcoma	138	118	133	121	134
Cancer	1,172	1,086	1,110	1,106	913

The number of deaths and the rate per 1,000 of the population for each of the counties and county boroughs are given in Tables 14 and 15 and similar information for urban and rural areas in Tables 16 and 17. In Abstracts IV to VI full particulars are given regarding the age at death and the number of deaths recorded for each urban and rural district.

In the aggregate urban areas the deaths for 1936 numbered 1,213 equivalent, to a rate of 1·26 per 1,000, and in the aggregate rural areas the number was 2,360 and the rate 1·18 per 1,000. In the previous year the urban and rural rates were respectively 1·17 and 1·20 per 1,000 of the population.

In Table L the parts of the body affected by fatal cases of cancer recorded in 1936 are shown. The excess of female mortality in persons under 50 years of age is apparent, but when that age has been passed, the excess in the male death-rate is more pronounced as age increases. The high female rate in middle life is attributable to the mortality of women from cancer of the uterus and breast; on the other hand the excess in the case of males in later life is due to the number of deaths from cancer of the buccal cavity and of the digestive system.

Tumours.—In accordance with the International List of causes of death, the particulars of deaths from tumours are shown in Abstract IV in two classes:—(1) those caused by tumours definitely described as non-malignant, and (2) those caused by tumours whose nature was undetermined or was not indicated in the entry in the register. The deaths in 1936 in the first group amounted to 80, and those in the second 81, compared with 67 and 116 in 1935.

The 80 non-malignant tumours comprised 21 of the uterus; 19 (11 males and 8 females) cerebral; 17 of the ovary; 10 (7 males and 3 females) of the bladder; 2 (one male and one female) of the stomach; 2 (males) of the spine, and one each of the following sites—leg, pancreas, skin, bone, liver, mediastinum and kidney; and 2 of ill-defined or unstated sites.

In 81 cases classified under the heading of tumours of undetermined nature the organs or parts affected were given as follows:—45 (25 of males and 20 of females) of the brain; 5 of each of the stomach and ovary, 4 of the intestine, 3 of the lung, 2 of each of the spine, liver, mediastinum, pituitary gland and pylorus. One death from tumour of each of the following sites was registered:—uterus, bladder, skin, thorax, medulla, abdomen, throat and pharynx. In the remaining case no information as to the part was stated.

DIAGRAM No. 4. Mortality from Cancer, 1922 to 1936.

Rheumatism.—There were 138 deaths (52 of males and 86 of females) registered in which the cause of death was given as an acute form of rheumatism. In 1935 the number of such deaths was 143—70 males and 73 females. The figure for 1936 includes 42 of children under 15 years and 31 of persons aged 15 and under 30 years at the time of death.

The number of deaths ascribed to chronic rheumatism was 153 (males 71 and females 82) and there were 110 (42 of males and 68 of females) from rheumatoid arthritis and osteoarthritis. The corresponding numbers for the previous year were 158 and 121 respectively.

and Cancer, Malignant Disease.

Diabetes.—Deaths from this cause numbered 287. This number shows an increase of 31 when compared with the figure for the year 1935. In Tables 6A, 7 and 7A the number of deaths for each year since 1911 are given. For the decennial period ended with 1920 the average number of deaths was 245, and in the subsequent decennial period the figure was 227. In the years 1931 to 1935 the deaths from this disease recorded numbered respectively 243, 239, 251, 267 and 256.

In the year 1936 the rate per 100,000 of the population represented by the deaths from this disease was 9·7, compared with 10·2 in Northern Ireland, 17·4 in England and Wales and 16·3 in Scotland.

The mortality in Saorstát Éireann among females from this disease in 1936 is less than that among males, the respective numbers being 136 and 151, and the equivalent rates 9·4 and 9·9 per 100,000. In England and Wales the female rate was 20·7 and the male 13·9, in Scotland 21·4 and 10·7, and in Northern Ireland 11·9 and 8·5 respectively.

Other General Diseases.—Other deaths in the group of general diseases include one (female) from beri-beri, one (male) from pellagra, 13 (10 males and 3 females) from rickets, one (male) from osteomalacia, 2 (one male and one female) from diseases of the pituitary gland, 16 (3 males and 13 females) from simple goitre, 62 (8 males and 54 females) from exophthalmic goitre, 12 (5 males and 7 females) from myxoedema, cretinism, 12 (8 males and 4 females) from tetany, 3 (one male and 2 females) from other diseases of the thyroid and parathyroid glands, 12 (7 males and 5 females) from diseases of the thymus, 25 (13 males and 12 females) from diseases of the adrenals, 8 (3 males and 5 females) from toxæmia, one (female) from acidosis, 2 (one male and one female) from amyloid disease, 3 (2 males and one female) from diabetes insipidus, and one (male) from hæmolytic jaundice.

Anæmia.—Deaths from pernicious anæmia numbered 255, comprising 115 of males and 140 of females. The total number is 34 above that for 1935 and 31 above the figure for 1934.

The number of deaths from other anæmias and chlorosis was 61, those of males numbering 22 and those of females 39. The number for 1935 was 56, males 21 and females 35.

Other Diseases of the Blood and Blood-forming Organs.—There were 31 deaths from purpura (21 males and 10 females); 4 (2 males and 2 females) from hæmophilia; 35 (17 males and 18 females) from leukæmia; 40 (22 males and 18 females) from aleukæmia (lymphadenoma, Hodgkin's disease); 4 (males) from diseases of the spleen; and 2 (males) from other diseases of the blood and blood-forming organs.

Alcoholism.—There were 10 deaths from alcoholism (9 males and one female). Cirrhosis of the liver caused 82 deaths, 58 being those of males and 24 of females.

Meningitis and Encephalitis.—Deaths from meningitis numbered 261, of which 146 were of males and 115 of females, as compared with 242, 139, and 103, respectively, in 1935.

The number of deaths described as from encephalitis (not returned as encephalitis lethargica) was 21, and from cerebral abscess 16, compared with 26 and 22 respectively for the preceding year.

Cerebral Hæmorrhage, Hemiplegia, etc.—The number of deaths classified under this heading (No. 82 in the International List) was 2,382 as compared with 2,273 in 1935. The average for ten years 1926–35 was 2,255. Of the total, cerebral hæmorrhage caused 1,408 deaths (600 males and 808 females); cerebral thrombosis and embolism 254 deaths (114 males and 140 females); cerebral softening, 23 deaths (12 males and 11 females); hemiplegia, 466 deaths (193 males and 273 females) and other paralyses of unstated origin, 231 deaths (106 males and 125 females).

Epilepsy.—There were 183 deaths (of males 106 and of females 77) from epilepsy, showing a decrease from this cause of 5 compared with that for the year 1935.

Convulsions (under 5 years of age).—The number of deaths ascribed to convulsions of children under 5 years of age was 354 (of males 193 and of females 161); of these 309, or 87·3 per cent., were those of infants under one year of age, constituting 7·2 per cent. of all deaths of infants during the year.

Heart Disease.—The deaths for 1936 under this heading amounted to 7,626, as compared with 7,026 in 1935 and 6,585 in 1934. The deaths from this cause represent 17·9 per cent. of the mortality from all causes and are equivalent to a rate of 2·57 per 1,000 of the population.

The annual average number of deaths from this cause registered during the decennial period 1926–1935 was 5,838.

Of the 7,626 deaths, 34 were from pericarditis, 107 from acute endocarditis, 1,719 from chronic endocarditis and valvular disease, 55 from acute myocarditis, 88 from fatty degeneration, 1,689 from chronic myocarditis and myocardial degeneration, 1,861 from unspecified myocardial disease, 344 from diseases of the coronary arteries and angina pectoris, and in 1,729 instances the particular form of heart disease was unstated, or was other than those enumerated above.

Other Circulatory Diseases.—Deaths from the causes included in this group amounted to 797—males numbered 442 and females 355. This number shows an increase of 131 and 115 respectively when compared with the figures for the years 1935 and 1934.

Of the diseases included in this group, arterio-sclerosis caused the greatest number of deaths—397; followed by gangrene 145; idiopathic abnormalities of blood pressure, 141; diseases of the veins, 45; aneurysm, 29; other diseases of the arteries, 24; diseases of the lymphatic system, 10; and other diseases of the circulatory system, 6 deaths.

Bronchitis.—Bronchitis caused 2,220 deaths (males 1,098 and females 1,122). This number is equal to a rate of 0.75 per 1,000 of the population and constitutes 5.2 per cent. of the total deaths registered. Of this number 476 were described as acute, 463 as chronic, and in 1,281 cases the form of the disease was not distinguished. The total number is 77 above that for 1935 and is 196 below the average for the preceding decennium.

Pneumonia.—There were 2,529 deaths from all forms of this disease affording a rate of 0.85 per 1,000 of the population; the total includes 1,216 from broncho-pneumonia, 384 from lobar pneumonia, and 929 from pneumonia (not otherwise defined). Of the total 1,409 deaths were of males and 1,120 of females.

The average number during the ten years 1926-35 was 2,553, and during 1935 the number recorded was 2,591.

Pleurisy; Empyema.—The number of deaths classified to empyema, regarding which an originating cause could not be ascertained, was 26 (the males numbering 20 and the females 6) in comparison with 25, 16 and 9, respectively, for last year. The deaths registered from other forms of pleurisy were 91, including 53 deaths of males and 38 of females; the figure for 1935 was 74 (49 males and 25 females).

Ulcer of the Stomach and Duodenum.—Deaths from this cause numbered 321; of this number 232 were males and 89 females. The total is 2 above that for 1935 and 40 above the figure for 1934.

Appendicitis.—Appendicitis caused 204 deaths (129 males and 75 females). This number is 25 more than that for 1935. Twenty-nine of the deaths for 1936 were of children under 10 years of age, as compared with 28 in the preceding year.

Cirrhosis of the Liver.—There were 82 deaths (58 of males and 24 of females) registered from this cause, compared with 66 in 1935 and 69 in 1934. Of the deaths from this cause 49 of the males and 19 of the females were of persons aged 45 years and upwards.

Acute and Chronic Nephritis.—The total number of deaths from nephritis was 1,187 (males 657 and females 530), compared with 1,264 for 1935 and 1,169 for 1934. The average number for the decennial period 1926-35 was 1,215. Of the total, 186 were tabulated as from acute nephritis (including deaths from nephritis undefined of persons under 10 years of age), 608 from chronic forms of the disease and in 393 cases from undefined forms of nephritis of persons aged 10 years and upwards.

Pregnancy and Childbirth.—Deaths of women during pregnancy and childbirth are grouped under three headings, namely, (1) deaths from septic conditions, (2) deaths from accidents and diseases of pregnancy and childbirth, and (3) deaths not classified to pregnancy or childbirth but returned as associated therewith. To the first group 104 deaths were assigned in year 1936, to the second, 169, and to the third 26; so that altogether the deaths of childbearing women numbered 299. This number, which is 2 above that for the year 1935, represents a rate of 5.14 per 1,000 of the total births registered, as compared with 5.10 in the year 1935, and an average rate of 5.07 for the decade 1926-35.

It will be seen from Table N. that deaths from puerperal septic diseases have increased by 15 in comparison with the figure for 1935, while the number of deaths from diseases and accidents of pregnancy and childbirth show a decrease of 14. The number of deaths from causes associated with the puerperal state is one more than that for the year 1935.

The number of deaths from puerperal septic diseases and other puerperal conditions are given (with the rates per 1,000 births represented thereby), by provinces, counties and county boroughs and groups of urban and rural areas in Tables 14 to 17.

VIOLENCE.

The number of deaths assigned to the group of violent or external causes (Group xvii, Abstract IV) during 1936 was 1,023. This figure shows an increase of 32 when compared with that for last year. The average figure for the ten years 1926 to 1935 from this group of causes was 935.

Deaths by suicide numbered 98, by homicide 19 (the term "homicide" is used to include infanticide); there were 5 by wounds of war, and of the remaining 901 deaths by violence, 850 were definitely stated to be accidental, and in 51 deaths the nature of the violence was unstated. The number of deaths by suicide is 6 more, whilst those by homicide are 2 less than the corresponding figures for last year.

Seventy-one of the suicidal deaths were males and 27 females. In 17 cases poisoning was the means used to cause death, including lysol in 5 instances, arsenic in 3, carbon monoxide in 3, and in the remaining cases iodine, strychnine, carbolic acid, liniment narcotic, and corrosive poison. In the other 81 deaths by suicide the means adopted was by hanging or strangulation in 28 instances, by cutting or piercing instruments in 24, by drowning in 15, by firearms in 7, and in 7 instances other means were used.

Deaths by homicide numbered 19—11 of males and 8 of females; four were cases of infanticide.

There were 14 accidental deaths from poisons and poisonous gases, 8 of which were due to carbon monoxide, 4 to smoke fumes, one to lysol, and one to Jeyes fluid.

Burns and scalds caused 173 deaths (71 males and 102 females) of which 74 were those of children under 5 years of age; the corresponding number of deaths of children in this age-group last year was 70.

Deaths from accidental drowning show a decrease of 40 (or 35·4 per cent.) compared with the figure for 1935. The number of deaths from this cause in 1936 was 73 (62 males and 11 females), 113 (95 of males and 18 of females) being registered in 1935.

A decrease of 21 took place in accidental deaths caused by vehicles. The number was 223 (179 of males and 44 of females). Deaths from motor-driven vehicles decreased to 152, the number in the previous year having been 158; deaths from horse-drawn vehicles numbered 32, which is 3 less than the number ascribed to this class of vehicle in 1935. Deaths by railway vehicles numbered 9 in 1936 compared with 18 in 1935. A decrease of 2 occurred in the number of fatal accidents due to bicycles, the numbers being 24 for 1936, and 26 for 1935. In 6 instances other vehicles were the cause of death.

The 152 deaths attributed to motor vehicles include 105 described as caused by "motors" or motor cars, 34 by motor lorries or vans, 9 by buses, and 4 by motor-cycles.

The 51 deaths in which the form of violence was not stated (i.e., accidental, homicidal or suicidal) included 34 from drowning, 4 from poisoning (one by barbituric luminal tablets, one by aspirin and camphor and 2 by carbon monoxide), and in the remaining 13 instances the nature or means of violence was not stated.

AGES AT DEATH.

The deaths of 5,836 children under 5 years of age were registered during 1936. This number is 13·7 per cent. of the total deaths recorded. The proportion of deaths of males at this age-period exceeds that of females, the rate for males being 14·6 per cent. of the male mortality and the rate for females 12·7 per cent. of the total number of deaths of females.

The deaths of persons aged 65 years and upwards numbered 20,345, constituting 47·8 per cent. of the total number of deaths, and include 10,208 deaths of males, or 46·6 per cent. of the total deaths of males, and 10,137 of females, or 49·1 per cent. of all the deaths of females.

Deaths at 70 years of age or over numbered 15,865, or 37·3 per cent. of the total deaths.

There were 218 deaths of persons aged 95 years or upwards (107 being males and 111 females), and of these 28 (11 males and 17 females) were stated to be aged 100 years or over.

The ages in detail of the persons whose deaths were registered in the year are given in Abstract III.

The following statement shows the variations in the death-rates at different age-periods between 1935 and 1936 :—

DEATH-RATES FOR EACH AGE-PERIOD PER 1,000 OF THE POPULATION AT THE SAME AGE.

AGE-PERIODS	PERSONS			MALES			FEMALES		
	1936	1935	Increase or Decrease in 1936	1936	1935	Increase or Decrease in 1936	1936	1935	Increase or Decrease in 1936
Under 5 years ...	20.35	19.33	+1.02	21.77	21.53	+0.24	18.84	17.02	+1.82

85 and upwards	150.94	144.01	+6.93	149.88	140.34	+9.54	151.80	146.98	+4.82
All Ages ...	14.37	13.98	+0.39	14.42	14.17	+0.25	14.32	13.78	+0.54

In Table 8 the number of deaths by sexes and ages, and the average annual rates per 1,000 of the population at the same ages, during 1864-70, the decennial periods from 1871 to 1930, and each year from 1926 to 1936 are given.

INFANT MORTALITY.

During the year 1936 the deaths of 4,309 infants under one year of age were registered. This number is equivalent to a rate of 74 per 1,000 births, as compared with 68 for last year, and an average of 69 for the ten years 1926-35. The rate for 1936 is the highest since the year 1926, when the rate was also 74. (See Table 4).

Of the total for the year under review 2,414 were those of males and 1,895 of females; the males were equal to a rate of 82 per 1,000 births of males, and the females to a rate of 66 per 1,000 births of females. The corresponding rates for 1935 were 78 and 58, respectively.

The infant mortality rate in Northern Ireland for 1936 was 77 per 1,000 births; in England and Wales, 59; and in Scotland, 82.

In the following Diagram (No. 5) the infant mortality rates for England and Wales, Scotland and Northern Ireland since 1922, as compared with that for Saorstát Éireann, are shown.

DIAGRAM No. 5. Infant Mortality, 1922 to 1936.

During the year 1936 the following causes accounted for over 80 per cent. of the total infant mortality, being equivalent in the aggregate to a rate of 60.01 per 1,000 births:—congenital debility 14.44 per 1,000 births, premature birth 11.31, diarrhoea and enteritis 10.38, pneumonia 8.96, convulsions 5.32, congenital malformations 4.44, bronchitis 2.96, and whooping-cough 2.20.

The deaths of infants during the first month of life were 40.5 per cent. of the total deaths of infants under one year of age. Between one and two months the percentage was 13.3, between 2 and 3 months 9.3, at 3 and under 6 months the rate was 18.2, and from 6 to 12 months old it was 18.7.

Urban and Rural Infant Mortality.

An increase in infant mortality was recorded for 1936 in the aggregate urban areas, where the number of deaths of infants was 2,200, as compared with 1,963 in 1935, the respective rates being 99 and 87. The mortality for rural areas also shows an increase, 2,109 infant deaths having been registered as against 2,025 in the previous year; the rates per 1,000 births are respectively 59 and 57.

Table 11 shows the high rate of infant mortality prevailing in urban districts as compared with rural districts, more especially in urban areas of 10,000 inhabitants and upwards (Thirteen Principal Towns); for these towns in the aggregate the rate is 103 per 1,000 births, as compared with 91 for the preceding year.

The rates for the individual towns are as follows, ranging from the highest to the lowest:— Dublin, 114; in each of Limerick and Bray, 95; Dundalk, 91; Waterford, 90; Dun Laoghaire, 89; Galway, 88; in each of Cork and Kilkenny, 79; Drogheda, 77; Wexford, 76; Sligo, 59; and Tralee, 38.

Deaths of infants in urban districts of less than 10,000 inhabitants were equivalent to a rate of 81 per 1,000 births, the rate for 1935 being 75.

The infant mortality rate for Belfast in 1936 was 101 per 1,000 births; for Londonderry it was 79; for London, 66; for Liverpool, 76; for Edinburgh, 68, and for Glasgow, 109 per 1,000 births.

The following statement shows the INFANT MORTALITY per 1,000 births, by sexes, at different periods of life in 1936 for the urban and rural areas in Saorstát Eireann:—

AGES	SAORSTAT EIREANN											
	Urban Areas 10,000 pop. & upwards			Urban Areas under 10,000 pop.			All Urban Areas.			All Rural Districts.		
	M. & F.	M.	F.	M. & F.	M.	F.	M. & F.	M.	F.	M. & F.	M.	F.
Under one Month	39.23	44.43	33.90	31.34	34.76	27.72	37.76	42.61	32.76	25.27	27.61	22.83
1-2 Months	13.44	16.88	9.92	10.60	10.80	10.40	12.91	15.74	10.01	7.96	8.75	7.13
2-3	8.15	9.37	6.91	10.12	9.39	10.89	8.52	9.37	7.64	5.89	6.12	5.65
3-6	19.83	21.78	17.84	13.26	13.62	12.87	18.61	20.24	16.93	10.30	10.77	9.81
6-12	21.93	22.76	21.07	16.15	21.14	10.89	20.85	22.46	19.20	9.47	10.44	8.45
Under one year	102.58	115.22	89.64	81.47	89.71	72.77	98.65	110.42	86.54	58.89	63.69	53.87

This statement shows the very large proportion of infants who died before completing their first month of life. Thirty-eight per cent. of the infants who died in urban areas, and 43 per cent. of those in rural districts, were under one month old. The contrast between the male and female mortality of infants is also apparent; in almost every instance the male mortality exceeds that of the females.

Deaths of Illegitimate Infants.

The number of deaths of illegitimate infants under one year of age registered during the year 1936 was 581, consisting of 323 deaths of males and 258 of females.

Table 12 shows the number of such deaths by causes and at different periods of life under one year of age. In Table 13 the deaths of illegitimate infants by counties and county boroughs, arranged according to the county of residence of the mothers, are shown. It will be observed that the great proportion of such deaths take place in institutions. Thus, of 46 deaths for Dublin county 44 took place in institutions, and of the 140 deaths for Dublin city, the number in institutions was 119, so that only 23 of the 186 deaths for Dublin county and city did not occur in institutions.

METEOROLOGY.

Particulars regarding meteorological observations taken at the Ordnance Survey Office, Phoenix Park, and at Roche's Point, Co. Cork, are published in the Quarterly Returns of Marriages, Births and Deaths. The following abstract of observations at Phoenix Park during the year is reproduced by permission of the Director of Ordnance Survey:—

**ABSTRACT OF METEOROLOGICAL OBSERVATIONS FOR THE YEAR 1936,
AT THE ORDNANCE SURVEY OFFICE, PHOENIX PARK, DUBLIN.**

Latitude 53° 21' 48.25" North. Longitude 6° 20' 59.15" West. Height above M.S.L. 155.3 Feet.

The highest Barometer during the Year was 1039.5 on 23rd December, at 9 a.m.
 The lowest " " " " 968.4 on 7th November, at 9 a.m.
 The highest Temperature " " 78.0 on 29th August.
 The lowest " " " " 19.0 on 13th January.
 Rain or Snow fell on 211 days during the year.
 The greatest Rainfall in 24 hours was 44.1 mms. on the 17th July, with Wind E.
 The prevailing Wind was W. 82 days.
 Calm 5 days.

Wind—S.W.

NOTE.—The above population, from 1801 to 1910, is derived from the estimated population of Ireland, already published in previous Annual Reports, by applying to the population the proportion in the Saorstát Éireann area, as disclosed at each Census. The variations between the proportions at each successive Census were distributed regularly over the intercensal periods.

From 1911 to 1925 the population was estimated by adding to the population at the Census of 1911 the number of births registered, and deducting the number of deaths registered and the number of emigrants enumerated each year. From 1922 the migration figures have been used in the estimates, the number of emigrants and immigrants having been furnished by the Department of Industry and Commerce. Adjustments were made for the years 1915-1921 to cover the movements of British military; and at the Census of 1926, the estimates were revised according to the difference disclosed between the estimate for that year (calculated to the Census date) and the population at the Census, by a distribution of the difference in arithmetical progression over the preceding fifteen years.

For the years 1926 to 1936 the estimate has been based on the population according to the Census of 1926, the natural increase (excess of births over deaths) and the passenger movement figures (including emigration and immigration) published by the Department of Industry and Commerce. The resulting estimates have been revised in accordance with the population according to the Census of 1936.

NOTE.—For 1923 and subsequent years the births and deaths on which the above rates are based have been assigned to the normal residence of the mother in the case of births and to that of the deceased in the case of deaths. Prior to 1923 the figures on which the rates were based were partially corrected for deaths in institutions. The rates given relate to the urban and rural areas as existing in the respective years.

TABLE 19.—DEATH RATES at different AGES per 1,000 of the corresponding populations for (1) Aggregate Urban Districts, and (2) Aggregate Rural Districts, in each of the years 1932-36.

ABSTRACT 1.—(continued).

MARRIAGES, BIRTHS AND DEATHS, 1936.—Superintendent Registrars' Districts, by Counties.—LEINSTER.

[Wherever the minus sign (—) is prefixed to the numbers given in the column headed "Excess of Births over Deaths," it denotes that the births, instead of exceeding the deaths, were, in fact, less than the deaths to the extent stated.]

APPENDIX I.

ALTERATION IN REGISTRARS' DISTRICTS, 1936.

CITY OF DUBLIN.

(1) As from the 1st January, 1936, a new Registrar's District known as North City No. 4 was created from certain portions of the existing Registrars' districts of North City No. 1 East, North City No. 1 West, and North City No. 2.

(2) As from the 1st July, 1936, the Registrar's District of Crumlin was divided into two districts known as Crumlin and Terenure respectively.

APPENDIX II.

Table showing the number of Searches made, Certificates issued, and the total amounts received as Fees for same at the General Register Office, Dublin, during the 73 years 1864-1936.

YEARS.	Number of Searches in the Registers.	Number of Certificates.	Amount received as Fees for Searches and Certificates.	YEARS.	Number of Searches in the Registers.	Number of Certificates.	Amount received as Fees for Searches and Certificates.
