REPORT ON VITAL STATISTICS FOR THE YEAR 1976

This Report has been prepared by the Central Statistics Office for the Minister for Health in accordance with the provisions of Section 2 of the Vital Statistics and Births, Deaths and Marriages Registration Act, 1952.

The statistics relate to the area in Ireland exclusive of Northern Ireland.

Births are classified according to the area of residence of the mother and deaths according to the area of residence of the deceased.

The number of births for each of the years 1943 to 1976 is exclusive of late registrations, and the number of deaths for each of the years 1940 to 1967 is exclusive of non-residents. From 1968 however the number of deaths includes non-residents.

The main statistics contained in this Report have already been published, and the Report consists mainly of a breakdown and analysis of these.

Prior to 1970 births and deaths were classified according to year of registration. In order to comply with United Nations regulations it was decided to classify births and deaths by year of occurrence from 1970 onwards. Because of this change in the basis of classification, those births and deaths which occurred in 1969 but were registered in 1970 have been recorded neither in the 1969 nor in the 1970 Report on Vital Statistics. The number of births excluded on this account was 2,545 and the number of deaths, 2,279. Appendix tables to the 1971 Report show these births classified by age of mother at maternity and number of previous children, while deaths are classified by cause, sex and age group.

NOTE: Following the availability of the Provisional Results of the Census of Population, 1979, it was found necessary to revise annual population estimates for the years subsequent to 1971. The data currently available permits only the revision of total population estimates. A subdivision of these estimates into age categories will not be possible until further results are available from the 1979 Census. Accordingly, tables in the Report which have historically included the estimated population classified by age-groups or have involved age-specific rates, etc. have been omitted. It is intended to include these figures in the Report on Vital Statistics, 1977. Tables which include aggregate rates related to the total population have been revised for the years 1972 to 1976.

GENERAL SUMMARY

Marriages.—There were 20,580 marriages registered during the year 1976 compared with 21,280 in 1975. The marriage rate per 1,000 population was 6.38 compared with 6.70 in 1975.

Births.—The number of births occurring during 1976 was 67,718 and the birth rate was 20.99 per 1,000 population, compared with 21.15 per 1,000 population in 1975. The number of illegitimate births registered in 1976 was 2,545 or 3.76 per cent of all births.

Deaths.—The number of deaths occurring during 1976 was 34,043 and the death rate was 10.55 per 1,000 population. In 1975 deaths numbered 33,173 and the rate was 10.44.

Of the deaths occurring in 1976, 31.17 per cent were stated to be due to ischaemic and other forms of heart disease, 19.50 per cent to other diseases of circulatory system, 18.46 per cent to cancer and 13.82 per cent to diseases of respiratory system.

There were 6,075 deaths from malignant neoplasms and neoplasms of lymphatic and haematopoietic tissues (excluding Hodgkin's disease and leukaemia and aleukaemia). This total is comparable with that for "cancer" in the 1949 and earlier Reports. The rate in 1976 was 1.88 per 1,000 population the same as that for 1975.

During 1976 the number of deaths occurring of infants under one year was 1,052 compared with 1,176 in 1975 giving rates of 15.54 and 17.51 respectively per 1,000 live births.

The total number of deaths from accidents and other external causes in 1976 was 1,562 of which road vehicle accidents accounted for 544.

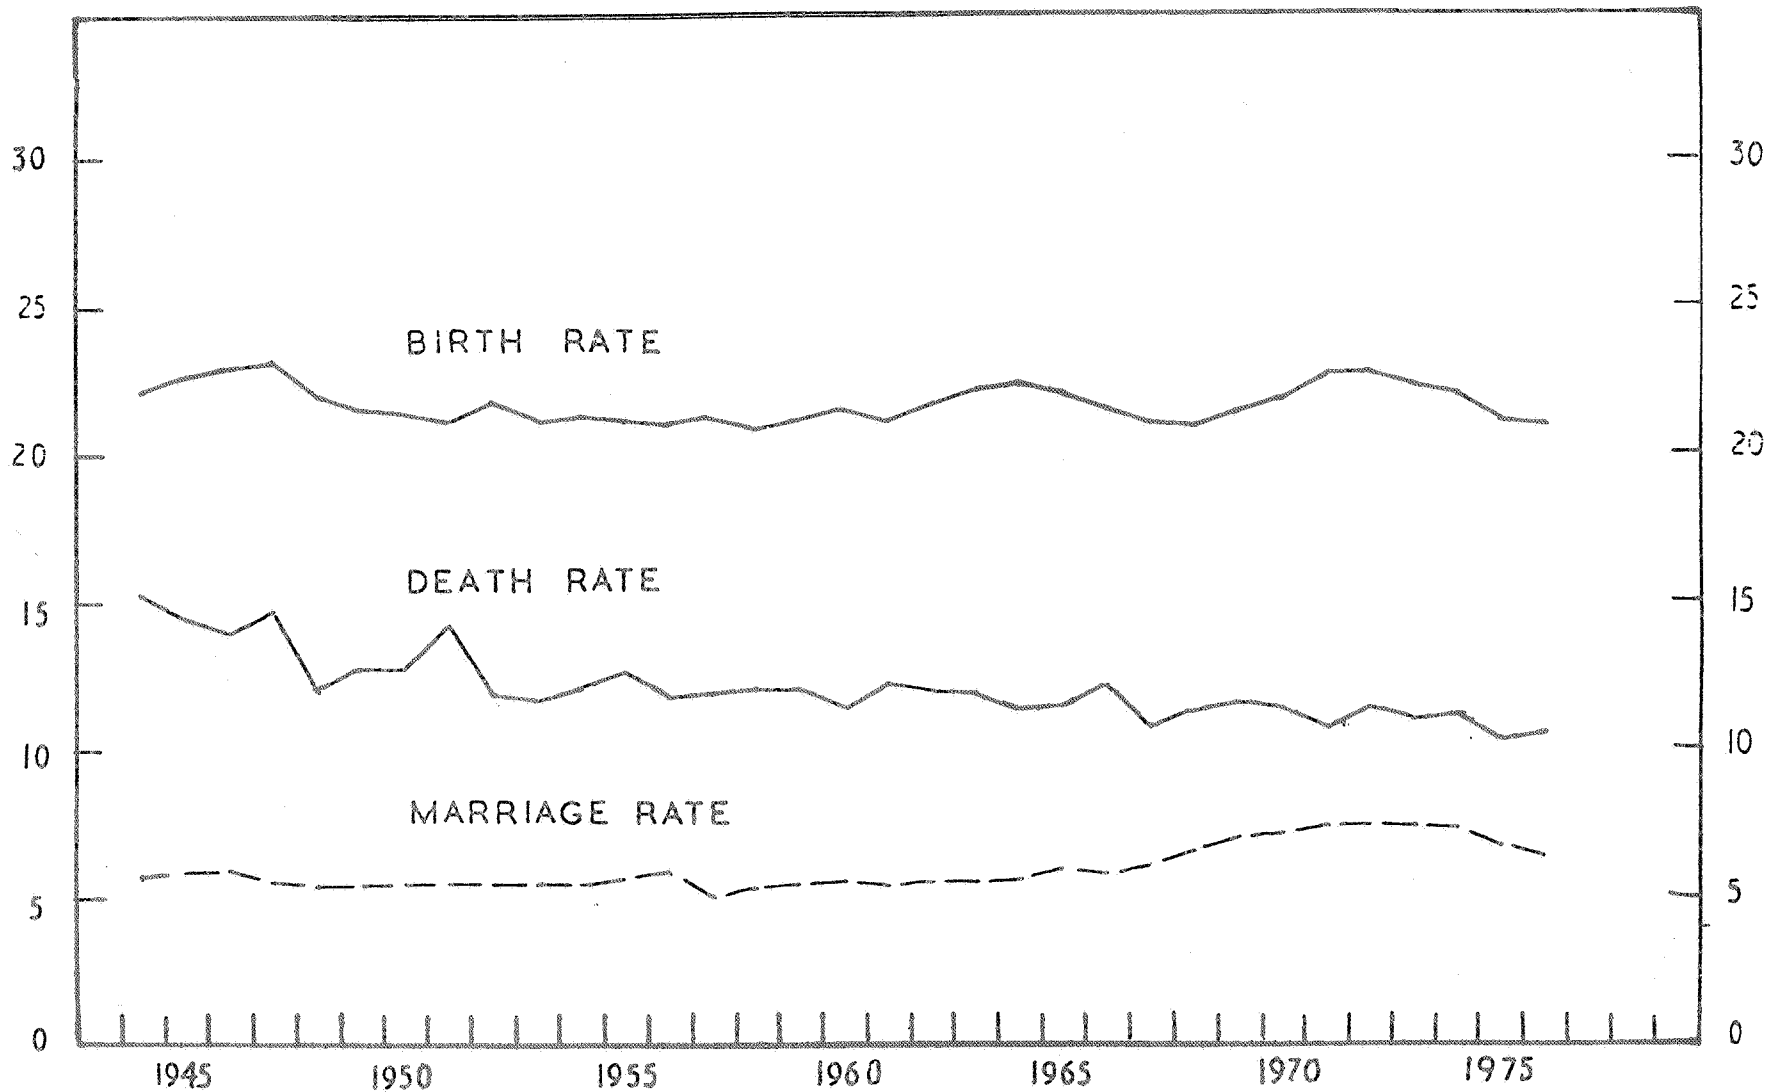

Marriage, birth and death rates per 1,000 population for the years 1943 to 1976 are illustrated in Diagram 1.

Issue of Authority for Registration.—Births and deaths which have not been registered within one year of their occurrence can be registered only on the authority of An tArd Chlaraitheoir. The number of such births registered on the authority of an tArd Chlaraitheoir in 1976 was 1,036 and the number of such deaths registered was 267. Throughout the tables in this Report these births and deaths have been excluded.

Population.— The estimated population in April 1976 was 3,226,000.

MARRIAGES

The number of marriages registered in 1976 was 20,580, a decrease of 700 on the previous year; the rate was 6.4 per 1,000 population, 0.3 below that for 1975. TABLES 3 and 4 of this Report show the average numbers of marriages registered and marriage rates for ten-year periods since 1864 and by single years since 1971. The following table compares the marriage rate in Ireland in the years 1941 to 1976 with those in Northern Ireland, England and Wales and Scotland.

AGE AT MARRIAGE

Particulars of the ages of persons marrying in this country were obtained at the 1946 Census of Population. At that Census persons were asked to state their date of marriage and a special analysis was made of 14,338 marriages which had taken place in the preceding twelve months and in the case of which the husband and wife were enumerated on the same census schedule. Corresponding data have been available since 1957 from marriage registrations and the results obtained since have made possible an examination of the trends in age at marriage over the intervening period, which are summarised in the following table.

TABLE II

Whereas, in 1945-46, 59.0 per cent of the men marrying were aged 30 years and over, the proportion over this age had fallen to 19.4 per cent in 1976, the average age of men at marriage declining from 33.1 years in 1945-46 to 26.4 years in 1976. In 1945-'46, 32.9 per cent of women marrying were aged 30 years and over compared with 10.9 per cent in 1976 while the average age at marriage declined from 28.0 years in 1945-46 to 24.1 in 1976. In TABLE 41 the marriages registered in 1976 are shown cross classified by age of groom and age of bride in single years while in TABLE 42 similar particulars are shown for marriages between bachelors and spinsters. From the latter table it may be calculated that the average ages of bachelors and spinsters marrying in 1976 were 26.0 and 23.8 respectively.

MODE OF CELEBRATION

The number of marriages celebrated in accordance with the rites and ceremonies of the Catholic Church registered in 1976 amounted to 19,665 (equal to 96 per cent of the total) and other marriages numbered 915, of which 490 were according to the rites and ceremonies of the Church of Ireland, 93 in Presbyterian Churches, 35 in Methodist Churches, 7 according to Jewish rites, 8 in accordance with the rites and ceremonies of other religious denominations and 282 by civil contract in Registrar's Office.

The rate for Catholic marriages in 1976 was 6.42 per 1,000 of the Catholic population, a decrease of 0.38 on the corresponding rate for 1975. The rate for all other marriages combined was 5.67 per 1,000 of the population other than Catholic, an increase of 0.87 on the 1975 rate.

† Average annual number of marriages and rates for decennial periods 1941-1960.

Marriages are classified according to form of ceremony, age of groom and age of bride in TABLES 43 and 44. For Catholic marriages the average age of the groom was 26.3 years compared with 29.6 years for other marriages (including Civil marriages). The average age of bride for Catholic marriages was 24.0 years and for other marriages, 26.3 years.

SOCIO-ECONOMIC GROUP

A classification which has been widely used in recent years in Census of Population statistics is that by Socio-economic Group. This classification is determined by a person's occupation or, in some cases, by a combination of occupation and employment status. The socio-economic group of a person not gainfully occupied is considered to be that of the gainfully occupied person on whom he or she is deemed to be dependent. The men and women married in 1976 were classified by socio-economic group on the basis of the information as to occupation given in the marriage register, and the results obtained are given in TABLES 45 to 47.

In TABLES 45 and 46 grooms and brides are classified by socio-economic group and age at marriage in each group. In the case of grooms and brides the average marriage age in 1976 was higher in the social group "Farmers, farmers' relatives assisting and farm managers" than in any other group. The lowest average was in the group "Other manual workers" for both grooms and brides.

TABLE 47 shows marriages registered in 1976 cross-classified by the social groups of groom and bride. Of the women marrying men in the "Skilled manual workers" group, in the case of whom occupation was stated, 62 per cent were in the "Intermediate and other non-manual workers" group, 24 per cent were other manual workers and 12 per cent were in the lower professional group, there being smaller percentages in each of the other groups. The distribution by socio-economic group of women marrying men in each of the remaining socio-economic groups may be considered in the same way. The table may also be examined by considering the socio-economic groups of the men marrying the women in each particular socio-economic group. Thus it will be seen that only 23 per cent of the women stated to be in the socio-economic group "Farmers, relatives assisting and farm managers" married men in socio-economic groups other than their own. A substantial number of women in the "Intermediate and other non-manual workers" groups married men in each of the other socio-economic groups. In the case of the majority of women in the "manual workers" groups the husbands belonged to the same groups.

AREA OF RESIDENCE

Four districts may be considered in relation to each marriage, namely that in which the marriage took place, the areas of residence of the bride and groom prior to marriage, and the intended future residence. In TABLE 40 figures for marriages according to place of occurrence are given for 1976. A comparison between the area of residence of the bride before the ceremony and the area in which the marriage took place is made in TABLE IV.

In TABLES 48 and 49 marriages are shown classified by area of residence prior to marriage and age group of groom and bride. Confining attention to the marriages in the case of which the area of residence was within the State, it will be seen that the average age at marriage was lower in predominantly urban than in rural areas. Thus in the four county boroughs the average age of grooms was not over 26 years, whereas in the counties Clare and Roscommon the average age was not less than 28 years. The average age of brides was not over 24 years in the four county boroughs. The lowest average age in the counties for brides was in Waterford and Offaly, 23.1 each and the highest in Roscommon, 25.3.

In TABLE 50 marriages are cross-classified by area of residence before marriage of groom and bride. As is to be expected, in the great majority of cases the groom and bride were from the same or neighbouring counties. A feature of the table is the large number of cases in which the address of the groom or bride or both groom and bride were outside the State. Thus 684 of the men married in the State in 1976 were returned as residing in England, Wales or Scotland, 339 in Northern Ireland and 218 in other countries. The number of brides who were resident before marriage in England, Wales or Scotland was 436, the number from Northern Ireland was 144 and the number from other countries was 91. In 570 cases both the groom and bride were from outside the State. In the past it has been the practice to compute marriage rates for counties and county boroughs by relating the marriages registered in each area to the resident population of that area.

It will be observed that rates (a) and (b) differ on account of the fact that marriages of men whose area of residence was outside the country were included in the calculation of rate (a) and excluded from rate (b). In the case of the question on intended future permanent residence, the accuracy of many of the entries was not as high as for the other information supplied. There were 673 marriages registered in which no information on future residence was provided.

OUTSIDE THE STATE 1967 TO 1976

1975	21,280	1,565	7.4
1976	20,580	1,454	7.1

As may be seen from Table VI the proportion of marriages with intended future residence outside the State shows a decline over the years. In the case of 796 marriages the future residence was in England and Wales, 271 in Northern Ireland, 49 in Scotland, 137 in other parts of Europe, 92 in the United States of America, 48 in Canada, 37 in Australia and New Zealand and 24 elsewhere. The age distributions and average ages of the grooms and brides going to the various countries are shown in TABLES 51 and 52 respectively. It will be seen that the average age of the men and women marrying and then going abroad was somewhat above the level of that for all marriages in the State. The marriages of persons going abroad are shown classified by socio-economic groups of groom and bride in TABLES 53 and 54 respectively. By comparing TABLES 45 and 53 it is possible to examine the proportions of men marrying in each socio-economic group who intended to reside outside the country, and it is found that this proportion varied considerably between the different groups. Table VI contains the results obtained.

A classification of marriages of persons going abroad, by form of marriage ceremony, is made in TABLE 55. With the aid of this Table it may be calculated that in 1976 in the case of Catholic marriages the percentage with intended future residence outside the State was 7 per cent maintaining the same level as in 1975. The corresponding figure for all other marriages was 16 per cent in 1976 the same as in 1975.

Finally, in TABLES 56 and 57 the marriages in the case of which the intended future residence was outside the State are shown classified by area of residence before marriage of groom and bride. The proportions which these marriages represent of the total when classified according to area of residence of groom are shown in Table VIII.

BIRTHS

The number of births occurring during the year 1976 was 67,718, comprised of 34,849 males and 32,869 females. The corresponding figures for 1975 were 67,178, 34,532, and 32,646 respectively. The birth rate in 1976 was 21.0 per 1,000 population, compared with 21.2 in 1975.

CLASSIFICATION BY AGE AT MATERNITY, PARITY AND DURATION OF MARRIAGE

Table 37 shows the total number of births registered in 1976 classified by age of mother at maternity and number of previous liveborn children. The number of births in the case of which the mother's age was not stated was 264 or 0.4 per cent of the total. In 1975 the corresponding figure was 136 or 0.2 per cent of the total. The results contained in TABLE 37 are summarised in Table X.

In preparing this table the procedure in the case of multiple births was to count each child as an individual birth. For instance if a fifth pregnancy produced twins the children would be classified as a fifth and sixth child in parity order.

Continuing the trend observed over the past decade there is in 1976 a shift towards the younger age groups in the distribution of births according to the age of mother at maternity. As may be calculated from Table XI, in 1976 mothers aged under 30 years at maternity accounted for 61.5 per cent of the births compared with 61.7 per cent in 1975, corresponding figures for England and Wales and Scotland for 1976 being 78.9 per cent and 80.4 per cent respectively, illustrating the difference between the countries.

The difference between this country and England and Wales and Scotland shown in Table XI is due to the facts that (a) women in Ireland marry at a later age and (b) married women in Ireland have on the average more children, as may be seen from Table XIII. When attention is confined to legitimate first births, in order to eliminate the effect of factor (b), the difference is still pronounced in the under 20 age group and in the age groups above 30 as may be seen from Table XII.

The difference between the years 1975 and 1976 in respect of the percentage distribution according to number of previous children was slight. The percentage of women with large families was considerably higher in Ireland than in England and Wales or Scotland. In Ireland in 1976, 9.0 per cent of the mothers had 5 or more previous children, the corresponding percentages being only 1.2 in England and Wales and 1.3 in Scotland.

MULTIPLE BIRTHS

The number of maternities in 1976 which resulted in multiple live births was 781 consisting of 777 sets of twins and 4 of triplets. This is equivalent to a "twinning rate" (number of live twins per 1,000 maternities which resulted in live births) of 11.7. Table XIV summarises the number of multiple births and the "twinning rate" for the years 1967 to 1976.

DEATHS

The number of deaths occurring during the year 1976 was 34,043 of which 18,465 were those of males and 15,578 those of females equivalent to a rate of 10.55 deaths per 1,000 total population, compared with 10.44 in the previous year, and 11.18 in 1974.

The crude death rate per 1,000 population has shown a gradual downward trend since the beginning of the century.

Table XVII compares the death rates in the years 1941-1976 with those in Northern Ireland, England and Wales and Scotland. The death rate in this country in 1976 was lower than in England and Wales and Scotland. Over the period covered in the table the decrease in this country has been greater than that in any of the other areas.

Attention should be drawn to the fact that these comparisons are based on crude death rates, which are to some extent affected by differences in the age-sex structures of the population in the different countries, while comparisons over a period of years are also affected by changes in the age-sex structures of the populations.

CAUSES OF DEATH

The tables in this Report showing causes of death are based on the Eighth Revision of the International Statistical Classification of Diseases, Injuries and Causes of Death prepared by the World Health Organisation. The Eighth Revision was used for the first time in classifying deaths by causes in the 1968 Report. The Reports from 1958 to 1967 were based on the Seventh Revision.

In Table XVI the number of deaths in the various disease groups in the years prior to 1968 have been adjusted to conform to the structure of the groups under the 8th Revision of the International Classification of Diseases.

From Table XVI it can be seen that the major difference between the periods 1955-57 and the year 1976 has been the drop in deaths from tuberculosis. The rate for 1976 was one-fifth of the rate in 1955-57. In the case of other infective and parasitic diseases the rate dropped to less than one-half of the 1955-57 rate. There were also significant falls in death rates from influenza and senility; in the case of senility the drop can be attributed to a decrease in the number of uncertified deaths and better certification of cause of death. Heart diseases remained the single biggest cause of death, followed by cancer, the rate for which showed an increase of 20 per cent.

Of the deaths occurring in 1976, 77 per cent were due to four main causes, i.e. ischaemic and other forms of heart disease, malignant neoplasms, cerebrovascular disease and respiratory diseases. Diseases of the heart were responsible for the highest rates, 387.4 per 100,000 population for males and 287.3 per 100,000 females. Most of these deaths occurred at ages over 55. Malignant neoplasms were the next major cause, the rates for which were 214.2, and 175.2 for males and females respectively per 100,000 population. The rates for cerebrovascular disease were 122.1 and 155.4 respectively for males and females per 100,000 population; as in the case of heart diseases the greater number of these deaths occurred at ages over 55. The deaths from respiratory diseases were due mainly to pneumonia and bronchitis.

Some of the principal causes of deaths are considered in greater detail in the following sections.

TUBERCULOSIS

In 1976 there were 165 deaths from tuberculosis, of which 97 were caused by the respiratory form and 68 by other forms of the disease. Between the period 1941-1950 and the year 1976 death rates from tuberculosis, particularly in the younger age groups, fell to a fraction of their former level. Of the 165 deaths in 1976, 93 per cent were in the age groups 45 and over.

The mortality from tuberculosis in the counties and county boroughs in 1976 is compared in Table 10 of this Report. The highest death rates from all forms per 1,000 population were in Leitrim County (0.14) and Kildare (0.11) while County Carlow had no deaths from tuberculosis.

CANCER

Prior to 1950 under the Fifth Revision of the International List of causes of death, cancer deaths were those classified under 045-055. With the introduction of the Sixth Revision in 1950 the World Health Organisation recommended that total cancer deaths should be based upon Nos. 140-205 (Nos. 140-209 in Eighth Revision) of the International Statistical classification which now included Hodgkin's disease and leukaemia, but for comparability with the years prior to 1950 the total cancer figure less Hodgkin's disease and leukaemia should also be shown.

In 1976 there were 6,284 deaths from cancer (Nos. 140 to 209). Of this number, 47 deaths were caused by Hodgkin's disease and 162 by leukaemia and aleukaemia. The trend in the death rates from cancer since 1946 is shown in Diagram 2 but it should be noted that for reasons given earlier the figures plotted in this diagram exclude deaths from Hodgkin's disease, leukaemia and aleukaemia.

The crude death rate from cancer in 1976 varied from 3.12 per 1,000 population in Leitrim to 1.10 in Dublin County (remainder).

The proportion of deaths not medically certified varies widely between the different areas (see Table 21), thus, the possibility that some cancer deaths in the areas with low medical certification may escape detection should be borne in mind in comparing the death rates between counties.

Full details of deaths due to cancer occurring in 1976, classified by site of the disease and age group are contained in TABLE 17. The number of deaths from cancer in each group for the main groups of sites are shown in Table XX. Deaths due to malignant neoplasms of the digestive system represented over one third of the total cancer deaths for each sex.

CANCER OF THE BRONCHUS, TRACHEA AND LUNG

The number of deaths and death rates from cancer of the bronchus, trachea and lung in each year 1965 to 1976, classified by sex and age group, are shown in Table XXI.

The main point that emerges from this table is that deaths from cancer of the bronchus, trachea and lung are much more common among males than among females. However, it should be noted that in the period under review deaths of women from cancer of the bronchus, trachea and lung have shown a remarkable increase.

The following table shows deaths and death rates from cancer of the bronchus, trachea and lung in Ireland and neighbouring countries during the years 1971 to 1976.

DISEASES OF THE CIRCULATORY SYSTEM

There were 17,247 deaths ascribed to diseases of the circulatory system (Nos. 390-458) in 1976 of which 9,170 were deaths of males and 8,077 of females. Details of these deaths, classified by cause and age may be obtained from TABLE 17 of this Report while the numbers assigned to each county and county borough are shown in TABLE 18. Deaths from certain groups of causes are given in Table XXIV.

The excess of male over female deaths in the case of diseases of the circulatory system is largely accounted for by the greater number of deaths of males from ischaemic heart disease (5,372 males compared with 3,468 females).

RESPIRATORY DISEASES

Deaths from respiratory diseases (Nos. 460-519 in the International List) in 1976 numbered 4,706. These included 427 deaths caused by influenza, 2,093 by pneumonia, 1,252 by bronchitis and 934 due to other respiratory diseases.

PREGNANCY, CHILDBIRTH AND PUERPERIUM

The number of maternal deaths in 1976 was 11 compared with 5 in 1975. The death rate was 0.16 per thousand maternities. TABLE XXV shows the maternal deaths in 1976 classified by age of mother and cause.

INFANT AND LATE FOETAL MORTALITY

The terms used in relation to infant and late foetal mortality are defined as follows:-

Infant death: Death at ages under 1 year of live born infant.

Early neo-natal death: Death at ages under 1 week of live born infant.

Neo-natal death: Death at ages under 4 weeks of live born infant.

Post-neo-natal death: Death between the ages of 4 weeks and 1 year of live born infant.

Late foetal death (stillbirth): Foetal death at or over 28 weeks gestation.

Perinatal deaths: Late foetal plus early neo-natal deaths.

Infant mortality rate: Infant deaths divided by total live births, multiplied by 1,000.

Neo-natal mortality rate: Neo-natal deaths divided by total live births, multiplied by 1,000.

Early neo-natal mortality rate: Early neo-natal deaths divided by total live births, multiplied by 1,000.

Late foetal mortality rate: Late foetal deaths divided by total live births plus late foetal deaths, multiplied by 1,000.

Perinatal mortality rate: Perinatal deaths divided by total live births plus late foetal deaths, multiplied by 1,000.

While statistics of infant mortality are obtained in the course of the usual procedure for registration of deaths, which has been in operation since the year 1863, particulars of late foetal mortality are obtained through a scheme of notification to the County Medical Officer of Health. The scheme of notifying late foetal deaths was introduced in 1957, but comparisons between different areas of the country showed marked differences in the coverage of the scheme in the early years. Consequently the number of late foetal deaths in the early years of the scheme is believed to be understated.

It will be seen from Table XXVII that the highest individual rate for infant mortality was in Clare and the lowest in Monaghan. The rate for perinatal mortality was highest in Kilkenny and lowest in Leitrim while for late foetal mortality the highest rate was in Kerry and the lowest in Leitrim.

INFANT MORTALITY

During the year 1976 there were 1,052 deaths of infants under one year, a decrease of 124 on 1975. The rate of 15.5 per 1,000 live births in 1976 is the lowest rate ever recorded.

The causes of deaths of infants under one year, classified according to the Detailed International List, are shown in TABLE 17. In TABLE 24 infant deaths are again classified by cause and a more detailed age classification shown. These results are summarised in Table XXX.

TABLE XXX

LATE FOETAL DEATHS AND DEATHS OF INFANTS UNDER 1 YEAR REGISTERED IN 1976 CLASSIFIED BY CAUSE AND AGE.

International List Numbers	Cause	Late foetal deaths	Deaths of infants under 1 year

	Other causes	435	21	14	7	42	84
	TOTAL	765	315	272	117	348	1,052

It will be seen that the relative importance of the various groups of causes differ appreciably between deaths at ages under one week and deaths at ages 4 weeks to one year. Of all deaths at ages under one week, 14 per cent were ascribed to immaturity, congenital anomalies accounted for 26 per cent, anoxic and hypoxic conditions not elsewhere specified (including asphyxia and atelectasis) 37 per cent and birth injuries 9 per cent.

At ages over 4 weeks congenital anomalies, respiratory diseases, and enteritis and other diarrhoeal diseases were the main causes of death. Details of the 84 deaths included as other causes will be found in Table 17 where it will be noted that 20 of these were due to accidents.

LATE FOETAL DEATHS

The number of late foetal deaths notified in each year since the scheme was introduced is as follows:-

Year	Late Foetal Deaths
Average 1957-1966	1,215
1967	1,000
1968	934

1974	867
1975	774
1976	765

The causes of late foetal deaths notified in 1976 classified according to the Detailed International List are given in Table 27. The results are summarised in Table XXXI.

More late foetal deaths resulted from placental and cord injuries than from any other group, being 29 per cent of the total deaths. Congenital anomalies of foetus was next at 20 per cent and haemolytic disease of the newborn at 3 per cent. Of the total deaths 17 per cent were classified as being due to ill-defined or unknown causes.

As can be seen from Table XXXII 742 late foetal deaths in 1976 occurred in hospitals; this is equivalent to 97 per cent of the total number of late foetal deaths.

ACCIDENTS, POISONING AND VIOLENCE

The number of deaths from external causes (Numbers E800-E999) occurring in 1976 was 1,562 of which 1,003 were males and 559 females. The corresponding figures for 1975 were 1,659, 1,047 and 612 respectively. In the Eighth Revision there is also a classification for deaths from external causes which are not specified as accidental or suicidal and which accounted for 79 deaths in 1976 (Table XXXV). In the Seventh Revision, 44 of these deaths would have been in the category Accidental drowning and 28 in the category Accidental poisoning, so for comparison with former years, they have been grouped with these categories in Table XXXIV.

As can be seen from Table XXXV there is an excess of male mortality from accidents at all ages between 1 and 75 years. In these age groups the excess of male deaths may be largely attributed to the category Road Vehicle Accidents. At ages over 75 years, the excess of female deaths may be attributed to accidental falls, as can be seen from Table XXXVI. The vast majority of these falls occurred in the home (Table XXXVI).

There were 533 deaths resulting from accidents in the home recorded in 1976 compared with 538 in 1975. As will be seen from Table XXXVI 370 deaths in 1976 were attributed to accidental falls in the home and these were mostly of elderly persons. Accidents caused by fire, hot liquids, etc., accounted for 83 deaths, of which 6 were of children under 5 years of age and 64 of persons aged 45 years and over. Nine deaths of children under one year old were due to obstruction and suffocation by food and 6 to accidental mechanical suffocation. There were 19 deaths from accidental poisoning, 15 of which were of persons aged 25 years and over.

UNCERTIFIED DEATHS

The number of cases in 1976 in which the cause of death was not certified by a medical practitioner was 145 which represents 0.4 per cent of the total deaths. In TABLE 21 uncertified deaths in 1976 are shown classified by county and age group, while the percentage of deaths uncertified in each county is also shown. The proportion of deaths uncertified is very high in the west, being highest in the year 1976 in the county Mayo (2.4 per cent).

Table XXXVII compares the percentages of deaths uncertified in each province for a number of years, and it will be observed that a steady improvement in the position is taking place.

Actual number of deaths uncertified	145	1	1	4	14	21	104

The proportion of deaths uncertified was highest in the age group 75 years and over; this age group accounted for more than seven-tenths of the uncertified deaths. In most age groups the provinces of Connacht and Ulster (part of) compare unfavourably with Leinster and Munster in respect of the percentage of deaths uncertified.

INQUESTS AND POST-MORTEMS

The number of deaths registered on certificates issued by coroners as the result of inquest and post-mortem examinations during 1976 was 3,151 compared with 3,059 in 1975.
