Report on Vital Statistics for the year 2000

This Report has been prepared by the Central Statistics Office for the Minister for Health and Children in accordance with the provisions of Section 2 of the Vital Statistics and Births, Deaths and Marriages Registration Act, 1952.

The main statistics contained in this Report have already been published, classified by year of registration, in the CSO Quarterly Vital Statistics reports. This annual report gives a further breakdown in respect of births and deaths which occurred in 2000. The year of occurrence data have been compiled from registration data for 2000 and 2001.

Information on marriages registered in 2000 is not included in the report but will be published separately when the data becomes available from the General Register Office.

This report includes statistics on stillbirths which became available following the introduction of a registration system under the Stillbirths Registration Act, 1994, and which replaced the series on late foetal deaths compiled up to 1994.

More up to date information on Vital Statistics is published in the Quarterly Report on Births, Deaths and Marriages published about five months after the end of the quarter to which the data relate. In the Quarterly Report, births and deaths are classified according to quarter of registration.

Births are classified according to the area of residence of the mother and deaths according to the area of residence of the deceased. Births and deaths for each year since 1943 exclude late registrations; while deaths for each of the years 1940 to 1967 exclude non-residents. From 1968 however, the number of deaths includes non-residents.

General Summary

Births: The number of births which occurred during 2000 was 54,789: 28,175 males and 26,614 females. The birth rate was 14.5 per 1,000 population compared with 14.4 in 1999. The number of births outside marriage which occurred in 2000 was 17,266 or 32% of all births.

Deaths: The number of deaths occurring during 2000 was 31,391: 16,192 males and 15,199 females. The death rate was 8.3 per 1,000 population. In 1999 deaths numbered 32,608 and the rate was 8.7.

Of the deaths occurring in 2000, 27.8% were due to ischaemic and other forms of heart disease; 24.4% to cancer; 12.6% to other diseases of the circulatory system and 15.5% to diseases of the respiratory system.

There were 7,666 deaths from malignant neoplasms and neoplasms of lymphatic and haematopoietic tissues. Of these, 24 were caused by Hodgkin's disease and 248 by leukaemia and aleukaemia. The death rate for cancer (ICD-9 nos. 140-208) in 2000 was 2.02 per 1,000 population, 0.01 more than in 1999.

During 2000 the number of deaths of infants under one year was 338 compared with 317 in 1999. The corresponding rate rose from 5.9 to 6.2 per 1,000 live births.

The total number of deaths from accidents and other external causes in 2000 was 1,752 of which motor vehicle accidents accounted for 411 deaths. The corresponding figures for 1999 were 1,818 and 413 respectively.

Stillbirths: The number of stillbirths occurring during 2000 was 325 compared with 311 in 1999. The corresponding rate rose from 5.7 to 5.9 per 1,000 live and stillborn children.

Population: The estimated population in April 2000 was 3,786,900: 1,880,600 males and 1,906,300 females.

Issue of Authority for Registration: Births and deaths (where no inquest has been held) which have not been registered within one year of their occurrence can be registered only on the authority of An Chlaraitheoir (Registrar General). The tables in the main body of this Report exclude such births and deaths. The Appendix to the Report contains an analysis of late death registrations in 2000 and of some deaths where an inquest has been held. The number of such deaths registered in 2000 was 457.

Births

The number of births which occurred in 2000 was 54,789 comprising 28,175 males and 26,614 females. The corresponding total for 1999 was 53,924, 27,817 males and 26,107 females. The birth rate in 2000 was 14.5 per 1,000 population, 0.1 above 1999.

Classification by age at maternity, parity and duration of marriage

Table 35 shows the total number of births which occurred in 2000 classified by age of mother at maternity and number of previous liveborn children (i.e. parity). The mother's age was not stated in respect of 261 births (or 0.5% of the total). In 1999 the corresponding number was 290 (0.5%). The results contained in Table 35 are summarised in Table II. In preparing this table the procedure in the case of multiple births was to count each child as an individual birth. For instance if a fifth pregnancy produced twins, the children would be classified as a fifth and sixth child in birth order.

Between the mid 1960's and the mid 1970's the percentage of mothers in the younger age groups increased, so that by 1975 mothers under 30 years accounted for 61.7% of births. Subsequently the proportion declined fairly steadily to reach 46.1% in 1999 and 45.1% in 2000. In England and Wales, and in Scotland in 2000, 53.6% and 53.3% respectively of young mothers were aged under 30.

¹ First Births of First Marriage in Scotland

Table V compares fertility rates in Ireland and England and Wales in 2000. In most age groups the number of births within marriage per 1,000 married women was considerably higher in Ireland than in England and Wales. The number of births outside marriage (i.e per 1,000 single, widowed, divorced and separated women) was mostly lower in Ireland than in England and Wales.

The total number of births outside marriage was 17,266 in 2000, i.e. 476 more than in 1999. This was equivalent to an annual rate of 30.4 per 1,000 unmarried females aged 15-49 years and was 31.5% of all births.

The lowest ever number of births outside marriage was recorded in 1959. The graph on page 13 illustrates the steady increase in the percentage of births outside marriage, notably since 1980.

¹ Since the number of births within marriage in the under 20 age group is small, caution should be exercised in the interpretation of trends in this rate.

The percentage distribution of births within marriage according to the number of previous children in 1999 and 2000 is shown in Table VI and a comparison made with the corresponding distributions in England and Wales and Scotland in 2000.

The percentage distribution of births according to previous number of children changed only slightly between 1999 and 2000, with the trend towards fewer previous children.

The percentage of mothers with two or more previous children was higher in Ireland than in either England and Wales or Scotland. In Ireland in 2000, 2.2% of mothers had 5 or more previous children compared to 1.2% in England and Wales and 0.8% in Scotland.

Total Period Fertility Rate

The total period fertility rate (TPFR) is derived from the age-specific fertility rates. It gives the theoretical average number of children who would be born alive to a woman during her lifetime if she were to pass through her childbearing years conforming to the age-specific fertility rates of a given year. A value of 2.1 is generally taken to be the level at which a generation would replace itself in the long run, ignoring migration.

The TPFR has fallen by more than a half in the past 30 years. In Ireland, it dropped below replacement level in 1989, then fell below 2.0 three years later, and stands at about 1.9. Despite the decline, we continue to have one of the highest fertility rates in Western Europe.

Calculation of Total Period Fertility Rate

The TPFR is compiled by summing the age specific fertility rates for the relevant five-year age groups, dividing by 1,000 and multiplying by 5. The small number of births for which the age of the mother is not stated is distributed in proportion to the stated categories.

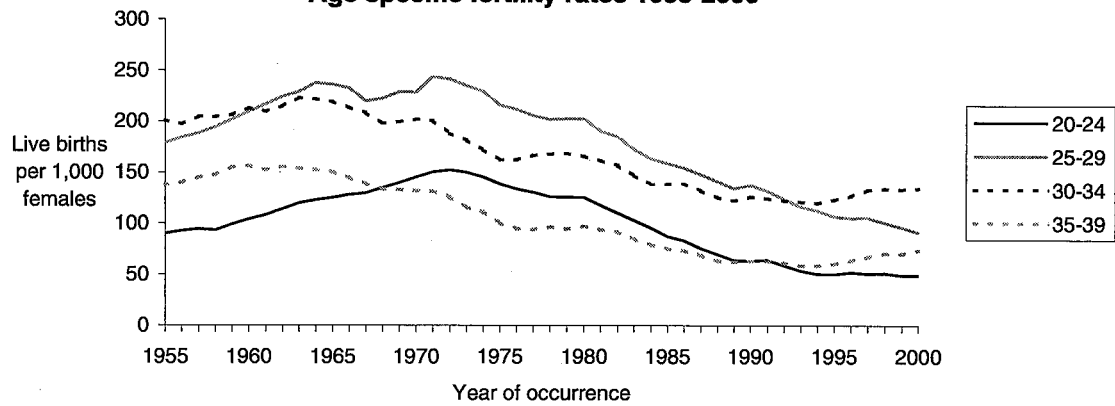

Percentage of births outside marriage 1922-2000

Births by order

Age specific fertility rates 1955-2000

Multiple Births

The number of maternities in 2000 which resulted in multiple live births was 743 consisting of 726 sets of twins and 16 sets of triplets and one set of quads. This is equivalent to a "twinning rate" of 13.4 (i.e. the number of live twins per 1,000 maternities which resulted in live births). Table VIII summarises the number of multiple births and the "twinning rate" for the years 1984 to 2000.

Live births

The terms used in relation to live births are defined as follows:

Parity: Parity is the number of previous live born children to a woman.

Birth Order: Birth order is the number of live born children a woman has in the order in which they are born.

Parity and Birth Order: A first birth relates to parity 0 or birth order 1 i.e. birth order = parity + 1.

Crude birth rate (CBR): The number of live births divided by the total population, multiplied by 1,000.

General fertility rate (GFR): The number of live births divided by the female population aged 15-49, multiplied by 1,000.

Age specific fertility rate (ASFR): The number of live births at a certain age (or age group) divided by the female population at that age (or age group), multiplied by 1,000.

Total period fertility rate (TPFR): The sum of the *ASFRs*, divided by 1,000 i.e. the expected number of children a woman will have in her lifetime based on the fertility of that year.

$$TPFR = \sum_{15}^{49} asfr \cong {}_5TPFR = 5 \sum_{15-19}^{45-49} asfr$$

Age specific reproduction rate (ASRR): The number of female live births at a certain age (or age group) divided by the female population at that age (or age group), multiplied by 1,000.

Gross reproduction rate (GRR): The sum of the *ASRRs* divided by 1,000 i.e. the expected number of daughters a woman will have in her lifetime based on the fertility of that year.

Net reproduction rate (NRR): The sum of the products of the *ASRRs* and the expected number of female years to be lived at that age, divided by 1,000 i.e. the *GRR* adjusted for female mortality.

The difference between the gross and net reproduction rates is an indicator of female mortality.

Average age at maternity: 0.5 plus the sum of the products of the ages at maternity of live births and their ages divided by the number of live births.

$$average\ age = 0.5 + \frac{\sum_{x=15}^{49} xf_x}{\sum_{x=15}^{49} f_x}$$

Average age at maternity of first birth: 0.5 plus the sum of the products of the ages at maternity of first live births and their ages divided by the number of first live births.

Childbearing years are regarded as between the ages of 15 and 49.

Live births to mothers aged less than 15 are included in the age 15 category and are divided by the age 15 population. Similarly live births to mothers aged greater than 49 are included in the age 49 category and are divided by the age 49 population.

The small number of births for which the age of the mother is not stated is distributed in proportion to the age.

Calculations are often by 5-year age group as that is the level the inter-census populations are published. When fertility rates are calculated by five-year age group instead of single year of age the result must be multiplied by five.

Average or mean ages: Live births where the age at maternity is not stated are excluded from the calculation.

Deaths

These were 31,391 deaths in Ireland in 2000, of which 16,192 were males and 15,199 were females. This is equivalent to a rate of 8.3 deaths per 1,000 total population compared to 8.7 in 1999 and 8.5 in 1998.

Table 11 shows the annual average death rates, by age group, for decennial periods from 1864 to 1990 and the death rates for each year 1990 to 2000. While the crude death rate per 1,000 population has shown a gradual downward trend since the beginning of the century, striking long-term falls occurred in the death rates at the younger ages.

Table IX compares the death rates in the years 1941-2000 with those in Northern Ireland, England and Wales and Scotland. The death rate in this country in 2000 was lower than in Northern Ireland, England and Wales and Scotland. Over the period covered in the table the decrease in this country has been greater than that in any of the other areas. These comparisons are based on crude death rates, which are to some extent affected by differences in the age-sex structures of the population in the different countries, while comparisons over a period of years are also affected by changes in the age-sex structures of the population.

Comparison between counties

Variations in the age distribution of the population from one county to another have an effect on the comparability of death rates between counties. If a particular county contains a large proportion of elderly persons the crude death rate per 1,000 population will be relatively high even if the health conditions in that county are better than the general average. In an attempt to overcome this, standardised rates are prepared. For a particular county this is done by calculating the death rate in each age group of the population in that county and then multiplying the death rate in each age group by the population in the whole country in that age group and summing the resulting products. See Table X. Throughout the remainder of the report, only crude death rates will be reported.

In certain areas the standardised death rates differ appreciably from the crude rates, the extremes being Fingal which had a crude death rate of 4.80 and a standardised rate of 8.54 (reflecting the very young age structure in Fingal) and Leitrim where standardisation had the effect of lowering the crude death rate from 12.80 to 8.62 because of the comparatively older age distribution in that county. The standardised rates in 2000 were lowest in South Dublin, (at 6.68 per thousand) and highest in Limerick County Borough (10.76 per thousand).

Comparability with data compiled pre 1996

Prior to 1996 the age groups used in calculating the crude and standardised death rates were as follows: 0-4, 5-14, 15-24 65-74, 75 and over. From 1996 onwards, 5-year age groups up to age 84 with an 85 and over category are used.

Causes of Death

The Ninth Revision of the International Classification of Diseases, Injuries and Causes of Death (ICD-9), as recommended by the World Health Organisation, has been used to classify deaths in Ireland by cause since 1979. It replaced the Eighth Revision (ICD-8) which was used from 1968 to 1978. To facilitate linkage with previous years all deaths in 1979 were, in addition, coded according to ICD-8. A cross-classification of deaths occurring in 1979 by the ICD-8 and ICD-9 classifications is contained in Tables 60-63 of the 1979 Report. As ICD-9 imposed certain changes in interpretation of recorded medical opinion regarding the underlying cause of death when more than one disease is mentioned on the medical certificate of cause of death, care should be taken in comparing deaths coded according to ICD-9 with those prior to 1979.

Injury and Poisoning:- This category forms part of the main body of classification in ICD-9 and deaths coded accordingly are shown in Table 19.

External Causes of Death:- In the Sixth, Seventh and Eighth Revisions the E-code was considered as part of the main classification. In ICD-9 the E-code is treated as a supplementary classification to be used where relevant in conjunction with codes from any part of the main classification.

Table XI shows that heart diseases remained the single biggest cause of death. Although the number of deaths from heart disease has fluctuated somewhat since 1980-82, the rate per 100,000 population has declined steadily over time.

Of the deaths occurring in 2000, 76% were due to the four main causes, i.e. Ischaemic and other forms of heart disease, malignant neoplasms, cerebrovascular disease and respiratory diseases. Most of these deaths occurred at ages over 65. Diseases of the heart were responsible for the highest rates, 252 per 100,000 population for males and 209 per 100,000 females. Malignant neoplasms were the next major cause, the rates for which were 217 and 188 for males and females respectively per 100,000 population. The rates for cerebrovascular disease were 59 and 85 respectively for males and females per 100,000 population. The deaths from respiratory diseases were due mainly to pneumonia. Table XII contains more information on deaths classified by causes and age groups.

Some of the principal causes of deaths are considered in greater detail in the following sections.

Tuberculosis

In 2000 there were 52 deaths from tuberculosis, of which 26 were caused by the respiratory form and 26 by other forms of the disease. Deaths from tuberculosis are now only at a fraction of their level 50 years ago. All of the 52 deaths in 2000 were in the age group 35 and over.

The mortality from tuberculosis in the counties and county boroughs in 2000 is compared in Tables 13 and 14 of this Report.

In the years under review the death rates from cancer showed little difference between males and females in the age groups under 34 years but between the ages 35 and 54 years the female rates were generally greater than those for males. In 2000 the male death rate for all ages was 15% above that for females.

Comparability with data compiled pre-1950:

Prior to 1950 under the Fifth Revision of the International List of Causes of Death, cancer deaths were those classified under codes 045–055. With the introduction of the Sixth Revision in 1950 the World Health Organisation recommended that total cancer deaths should be based upon Nos. 140–205 (Nos. 140–208 in the Ninth Revision) of the international statistical classification which now includes Hodgkin's disease and leukaemia. Thus, for comparability with the years prior to 1950 the total cancer figure less Hodgkin's disease and leukaemia should also be shown. In 2000 there were 7,666 deaths from cancer (Nos. 140 to 208). Of this number 24 deaths were caused by Hodgkin's disease and 248 by leukaemia and aleukaemia.

*Exclusive of Northern Ireland

In the period under review the crude rates for England and Wales and Scotland were consistently higher than those for this country and Northern Ireland.

The death rates from cancer in 2000 in counties and county boroughs are compared in Table XVI. Standardised rates, which reduce the effect of different age distributions in the different areas, are also shown. The crude death rate from cancer in 2000 varied from 2.71 per 1,000 population in Leitrim to 1.08 in South Dublin. When comparing the relative seriousness of mortality in different counties it is, of course, the standardised rates which should be used. In the counties of the west and north–west, standardisation generally had the effect of lowering the death rates considerably. Again, throughout the remainder of this report, only crude death rates will be reported.

Full details of deaths due to cancer occurring in 2000, classified by site of the disease and age group are contained in Table 19. The number of deaths and death rates from cancer per 100,000 in each group for the main groups of sites are shown in Table XVII, which shows that there is, in general, a rapid rise in the death rate with increasing age. Deaths due to malignant neoplasms of the digestive system represented nearly one third of the total cancer deaths for males, the death rate for males being 30% higher than that for females.

Diseases of the circulatory system

There were 12,666 deaths ascribed to diseases of the circulatory system (Nos. 390–459) in 2000, of which 6,449 were deaths of males and 6,217 of females. Details of these deaths, classified by cause and age may be obtained from Table 19 of this report while the numbers assigned to each county and county borough are shown in Table 20. Deaths and death rates from certain groups of causes are given in Table XX.

The excess of male over female deaths is largely reflected in the number of deaths from ischaemic heart disease (3,778 males compared with 2,811 females), the majority of which were due to acute myocardial infarction (2,251 males compared with 1,762 females). The converse is true for cerebrovascular disease (1,622 females compared with 1,116 males). In respect of the remaining groups of causes the difference between the male and female death rates is not nearly so pronounced.

Respiratory Diseases

Deaths from respiratory diseases (Nos. 460–519 in the International List) in 2000 numbered 4,863. These included 2,474 deaths from pneumonia, 109 from bronchitis, 44 from influenza and 2,236 due to other respiratory diseases.

Pregnancy, childbirth and puerperium

There was 1 maternal death in 2000, the same as in 1999.

Table XXI shows the maternal deaths in 2000 classified by age of mother and cause, while Table XXII compares Ireland and the neighbouring countries for the years 1983 – 2000.

Stillbirths and Infant Mortality

The terms used in relation to stillbirths and infant mortality are defined as follows:

Stillbirth: Stillbirth weighing 500 grams or more or at gestational age of 24 weeks or more. This definition applies to stillbirth figures from 1995 onwards.

Late foetal death: Foetal death at or over 28 weeks gestation. This definition was applied up to 1994 inclusive.

Early neonatal death: Death at ages under 1 week of live born infant.

Perinatal deaths: Stillbirths or late foetal deaths plus early neonatal deaths.

Late neonatal death: Death between the ages of 1 week and 4 weeks of live born infant.

Neonatal death: Death at ages under 4 weeks of live born infant.

Post neonatal death: Death between the ages of 4 weeks and 1 year of live born infant.

Infant death: Death at ages under 1 year of live born infant.

Stillbirth rate: Stillbirths divided by total live births plus stillbirths, multiplied by 1,000.

Late foetal mortality rate: Late foetal deaths divided by total live births plus late foetal deaths, multiplied by 1,000.

Early neonatal mortality rate: Early neonatal deaths divided by total live births, multiplied by 1,000.

Perinatal mortality rate: Perinatal deaths divided by total live births plus stillbirths, multiplied by 1,000.

Late neonatal mortality rate: Late neonatal deaths divided by total live births, multiplied by 1,000.

Neonatal mortality rate: Neonatal deaths divided by total live births, multiplied by 1,000.

Post neonatal mortality rate: Post neonatal deaths divided by total live births, multiplied by 1,000.

Infant mortality rate: Infant deaths divided by total live births, multiplied by 1,000.

While statistics of infant mortality are obtained in the course of the usual procedure for registration of deaths, which has been in operation since 1863, particulars of late foetal mortality have been obtained through a scheme of notification to the Directors of Community Care. The scheme of notifying late foetal deaths was introduced in 1957, but comparisons between different areas of the country showed marked differences in the coverage of the scheme in the early years. Consequently, the number of late foetal deaths in the early years of the scheme is believed to be understated.

In 1995 stillbirths were registered in Ireland for the first time under the Stillbirths Registration Act, 1994. The definition of a stillbirth under the Act is broader than the definition used for late foetal deaths in previous Vital Statistics Reports (see above). This report contains tables in relation to 325 stillbirths which occurred in 2000 including twenty two stillbirths for which a statistical return was received but which had not been registered. This compares with 311 stillbirths in 1999. Care should be taken in comparing statistics on stillbirths and late foetal deaths in consideration of the changes between the notification and registration systems.

Table XXV shows that the highest county rate for infant mortality was in Carlow and the lowest in Kilkenny. The rate for perinatal mortality was highest in Cork County Borough and lowest in Leitrim, which had no perinatal deaths in 2000. For stillbirths the highest rate was in Cork County Borough and lowest in Leitrim and Roscommon which had none.

4 Figures on stillbirths up to 1994 inclusive refer to the definition of late foetal deaths at or over 28 weeks gestation. From 1995 the figures relate to the new broader definition of stillbirths at or over 500g or at a gestational age of 24 weeks or more. For comparison purposes, figures according to the old definition are given in brackets from 1995 onwards.

Infant mortality

During the year 2000 there were 338 deaths of infants under one year, compared to 317 in 1999. The infant mortality rate, which was 5.9 per 1,000 births in 1999, rose to 6.2 in 2000.

The causes of deaths of infants under one year, classified according to the Detailed International List, are shown in Table 19. In Table 25 infant deaths are again classified by cause and a more detailed age classification shown. These results are summarised in Table XXVIII.

The relative importance of the various groups of causes differs appreciably between deaths of infants aged under one week and deaths at ages 4 weeks to 1 year. Of all deaths at ages under one week, 44% were due to congenital anomalies. The most common cause of death for infants aged 4 weeks to 1 year was Sudden death (38%) followed by congenital anomalies (26%).

Deaths classified as being due to ill-defined conditions originating in the perinatal period accounted for 31% of the stillbirths. Deaths due to congenital anomalies and deaths due to anoxic and hypoxic conditions not elsewhere classified, were next at 13% each.

As can be seen from Table XXIX 304 stillbirths in 2000 occurred in hospitals; this is equivalent to 94% of the total number of stillbirths. The perinatal mortality and stillbirth rates in Ireland and neighbouring countries from 1980 to 2000 are compared in Table XXX.

¹ For purposes, the rates in the table are based on foetal deaths at or over 28 weeks gestation. The rates in brackets for 1995-2000 refer to foetal deaths at or over 24 weeks gestation.

² Exclusive of Northern Ireland.

Accidents, poisoning and violence

The number of deaths from external causes (numbers E800–E999) occurring in 2000 was 1,752 of which 1,215 were males and 537 were females. The corresponding figures for 1999 were 1,818 deaths – 1,283 male and 535 female. As has been mentioned on page 7 deaths which have not been registered within one year of their occurrence have been excluded from the main body of this report. The exclusion of these cases may have a relatively more significant effect on the number of deaths classified to some external causes.

As can be seen from Table XXXII there is an excess of male mortality from accidents which may be largely attributed to the category suicide and self-inflicted injury followed by road vehicle accidents. At ages over 75 years, the excess of female deaths may be attributed to accidental falls.

As can be seen from Table XXXIII below, 331 deaths resulted from accidents in the home. This compares with 398 in 1999. Of the 331 deaths in 2000, 159 were accidental falls, and over half of these were in the 75 years and over age category. Accidents caused by fire and flames accounted for 46 deaths, 3 of which were in the under 5 age group. There were 86 deaths from accidental poisoning.

Uncertified deaths

There were 30 cases in 2000 in which the cause of death was not certified by a medical practitioner, which represents 0.1% of the total deaths. This is much lower than the 8.5% in the period 1951-1960 and the 3.1% in the period 1961-70.

Inquests and post-mortems

The number of deaths registered on certificates issued by coroners as the result of inquest and post-mortem examinations during 2000 was 4,457 compared with 4,516 in 1999.
