# Industrial Production \& Turnover <br> September 2005 (Provisional) and August 2005 (Final) 

## Manufacturing Industries <br> (Base: year 2000=100)

Production
Turnover
Seasonally adjusted

| September 2004 | 120.5 | 109.0 |
| ---: | ---: | ---: |
| September 2005 | 121.0 | 109.7 |
| \% change | $+0.4 \%$ | $+0.6 \%$ |
|  |  |  |
| Apr-Jun 2005 | 122.3 | 111.8 |
| Jul-Sep 2005 | 129.0 | 108.7 |
| \% change | $+5.5 \%$ | $-2.8 \%$ |

## Production up 5.5\% in latest quarter

The seasonally adjusted volume of industrial production for manufacturing industries for the three month period July to September 2005 was up $5.5 \%$ on the preceding three month period (see above and Table 4).

On an annual basis production for All Industries in September 2005 was $0.4 \%$ higher than in September 2004 (see Table 1). The "Modern Sector", comprising a number of high-technology and chemical sectors, showed an annual decrease in production for September 2005 of $0.9 \%$, while an increase of $3.4 \%$ was recorded in the "Traditional" sector (see Table 2).

The seasonally adjusted industrial turnover for manufacturing industries was $2.8 \%$ lower in the three month period July to September 2005 when compared with the preceding three month period (see above and Table 7). On an annual basis turnover in September 2005 was 0.6\% higher than in September 2004.

1 All data for latest month are provisional

## Background Notes

Introduction The monthly industrial production index monitors current trends in the volume of production of industrial local units with three or more persons engaged. The primary purpose of the index is to measure changes in value added at constant prices.

The monthly index of turnover measures the change in the level of sales each month of industrial products, whether manufactured in the month in question or in previous periods (excluding non-industrial activity where practicable). The turnover indices outlined in this release are exclusive of VAT.

The principal difference between the production and turnover indices is that the production index traces the quantitative volume of production (i.e. effect of price changes excluded) each month, whether sold or not, whereas the turnover index reflects both the volume of sales and the price level. Starting with January 2004 updated industrial production and turnover indices are being published to base year $2000=100$.

The new orders indices measures trends in new orders accepted, including those received and filled during the last month. Orders are valued at the amounts invoiced or still to be invoiced (excluding VAT).

## Sample covered

The monthly survey which provides data for calculating the indices covers the larger local units which between them account for the bulk of industrial output - in general those which in the base year 2000 had twenty or more persons engaged. For certain sectors the threshold of 20 persons engaged is lowered where this is considered necessary to ensure representativeness of the sample or where data for a sector would have to be kept confidential if the 20 persons engaged threshold were applied. The business activity classifications are based on the Statistical Classification of Economic Activities in the European Community (Nace Rev.1.1).

Methodology Working day adjusted individual production, turnover and new orders sub-indices are compiled for each detailed NACE class. These sub-indices are combined to provide the indices for broader sectoral groupings, using as weights for a sector the gross value added at factor cost for production indices, and turnover in goods produced and industrial services provided to others for turnover and new orders indices, for all units in that sector covered in the 2000 Census of Industrial Production (CIP). Weights and base year are revised every five years.

The production index is compiled by valuing quantitative commodity data at base year prices. The series has been compiled using updated prices from the Prodcom 2000 survey. In cases where reliable quantity data cannot be obtained current value data is converted to values at base year prices using suitable Wholesale Price Index (WPI) deflators.

New orders indices have been produced from January 2004 onwards using reported monthly orders data. In the event of non-response, the reported turnover is used as an estimate for the calculation of new orders indices.

Seasonal The indices are adjusted using the multiplicative version of the X-11 Variant of the US Bureau Adjustment of the Census Method II Seasonal Adjustment Program. This seasonal adjustment process is carried out once a year using the latest (currently up to and including December 2004) monthly production patterns available. Each index is independently seasonally adjusted i.e. the adjusted indices of groupings of sectors are not systematically derivable as weighted averages of their component parts.

Retrospection To enable comparisons to be made with earlier periods efforts were made to re-cast indices calculated under the previous system (base year $1995=100$ ) to take account of the changes between the old and current systems. It must be emphasised that the results of this exercise are of an approximate nature. Aggregate indices have been re-calculated using the 2000 sectoral weights from January 2001. All indices prior to 2001 have been re-scaled to take account of the base year $2000=100$.
