Industrial Production & Turnover June 2005 (*Provisional*) and May 2005 (*Final*)

Manufacturing Industries (Base: year 2000=100)

	Production Seasona	Turnover Ily adjusted
June 2004	122.6	110.4
June 2005	123.2	113.7
% change	+0.5%	+3.0%
Jan-Mar 2005	120.6	109.3
Apr-Jun 2005	121.7	111.5
% change	+0.9%	+2.0%

Production up 0.9% in latest quarter

The seasonally adjusted volume of industrial production for manufacturing industries for the three month period April to June 2005 was up 0.9% on the preceding three month period (see above and Table 4).

On an annual basis production for All Industries in June 2005 was 0.4% higher than in June 2004 (see Table 1). The "Modern Sector", comprising a number of high-technology and chemical sectors, showed an annual increase in production for June 2005 of 0.5%, while an increase of 0.3% was recorded in the "Traditional" sector (see Table 2).

The seasonally adjusted industrial turnover for manufacturing industries was 2.0% higher in the three month period April to June 2005 when compared with the preceding three month period (*see above and Table 7*). On an annual basis turnover in June 2005 was 3.0% higher than in June 2004.

This release contains two new tables which show trends in new orders received for the manufacturing sector (*see Background Notes for further information*). New orders indices for selected industrial sectors are given in Table 10. The seasonally adjusted indices for new orders are given in Table 11.

For more information contact Patsy King on 021-4535502 or Gerry Brett on 021-4535541.

Background Notes

Introduction

The monthly industrial production index monitors current trends in the volume of production of industrial local units with three or more persons engaged. The primary purpose of the index is to measure changes in value added at constant prices.

The monthly index of turnover measures the change in the level of sales each month of industrial products, whether manufactured in the month in question or in previous periods (excluding non-industrial activity where practicable). The turnover indices outlined in this release are exclusive of VAT.

The principal difference between the production and turnover indices is that the production index traces the quantitative volume of production (i.e. effect of price changes excluded) each month, whether sold or not, whereas the turnover index reflects both the volume of sales and the price level. Starting with January 2004 updated industrial production and turnover indices are being published to base year 2000=100.

The new orders indices measures trends in new orders accepted, including those received and filled during the last month. Orders are valued at the amounts invoiced or still to be invoiced (excluding VAT).

Sample covered

The monthly survey which provides data for calculating the indices covers the larger local units which between them account for the bulk of industrial output — in general those which in the base year 2000 had twenty or more persons engaged. For certain sectors the threshold of 20 persons engaged is lowered where this is considered necessary to ensure representativeness of the sample or where data for a sector would have to be kept confidential if the 20 persons engaged threshold were applied. The business activity classifications are based on the Statistical Classification of Economic Activities in the European Community (Nace Rev.1.1).

Methodology

Working day adjusted individual production, turnover and new orders sub-indices are compiled for each detailed NACE class. These sub-indices are combined to provide the indices for broader sectoral groupings, using as weights for a sector the gross value added at factor cost for production indices, and turnover in goods produced and industrial services provided to others for turnover and new orders indices, for all units in that sector covered in the 2000 Census of Industrial Production (CIP). Weights and base year are revised every five years.

The production index is compiled by valuing quantitative commodity data at base year prices. The series has been compiled using updated prices from the Prodcom 2000 survey. In cases where reliable quantity data cannot be obtained current value data is converted to values at base year prices using suitable Wholesale Price Index (WPI) deflators.

New orders indices have been produced from January 2004 onwards using reported monthly orders data. In the event of non-response, the reported turnover is used as an estimate for the calculation of new orders indices.

Seasonal Adjustment

The indices are adjusted using the multiplicative version of the X-11 Variant of the US Bureau of the Census Method II Seasonal Adjustment Program. This seasonal adjustment process is carried out once a year using the latest (currently up to and including December 2004) monthly production patterns available. Each index is independently seasonally adjusted i.e. the adjusted indices of groupings of sectors are not systematically derivable as weighted averages of their component parts.

Retrospection

To enable comparisons to be made with earlier periods efforts were made to re-cast indices calculated under the previous system (base year 1995=100) to take account of the changes between the old and current systems. It must be emphasised that the results of this exercise are of an approximate nature. Aggregate indices have been re-calculated using the 2000 sectoral weights from January 2001. All indices prior to 2001 have been re-scaled to take account of the base year 2000=100.
