Monthly Services Index

September 2012 (Provisional)

August 2012 (Final)

Monthly Services Index

Monthly Services Index
(Base Year 2009 = 100)

	Value Index	Monthly % Changes	Annual % Changes
September 2011	99.1	-0.4%	2.1%
August 2012	105.4	0.4%	5.9%
September 2012	102.3	-2.9%	3.3%

Monthly Services Index decreased 2.9% in September 2012

The seasonally adjusted monthly services value index decreased by 2.9% in September 2012 when compared with August 2012; however there was an annual increase of 3.3%. The contribution of each sector to these changes in the overall, seasonally adjusted, Monthly Services Index are outlined in graphs on page 6.

Information and Communication (-6.7%), Accommodation and Food Service Activities (-2.9%), Wholesale and Retail Trade (-2.0%), Business Services (-1.9%) Transportation and Storage (-1.3%) and Other Services (-0.5%) showed respective month on month decreases in September 2012.

Transportation and Storage (+14.2%), Accommodation and Food Service Activities (+3.4%) Information and Communication (+2.8%), Wholesale and Retail Trade (+2.5%) and Other Services (+2.1%) showed year on year increases in September 2012 when compared with September 2011. Only Business Services showed a year on year decrease of 0.3%.

The services index for the third quarter of 2012 increased by 0.6% when compared with the preceding quarter and by 5.6% when compared with the same quarter in 2011.

Unadjusted figures for the monthly services value index are available on the CSO website, www.cso.ie.

Year on Year Change of 3.3% - September 2012**

Background Notes

Introduction The monthly services value index monitors trends in output at current prices of enterprises in the non-financial traded services sector. This is the first step in the development of a Services Production Index that measures gross value added changes at constant prices, i.e. a volume index.

Sample covered The sample size is approximately 2,100 enterprises. The sample comprises a census of all enterprises with an annual turnover value of more than €20.0M or enterprises with more than 100 persons engaged. The remainder of the target population is stratified using 2-digit Statistical Classification of Economic Activities in the European Community, i.e. NACE Rev. 2 classifications. Each of these 2-digit NACE sectors are further subdivided into strata based on turnover. A simple random sample is then drawn from each stratum. Retail and Motor Trade figures are taken from the separate Retail Sales Index sample of approximately 1,400 enterprises.

The response rates for the provisional results are typically 49% in terms of the enterprises surveyed which represents 70% of the value of total turnover. The corresponding figures for the final results are 59% and 88% respectively. These response rates are based on averages for the 6 month period ending March 2012.

Methodology The business activity classifications used in this Statistical release are based on the Statistical Classification of Economic Activities in the European Community i.e. NACE Rev. 2. For further information on the NACE Rev. 2 classification of services activity, visit the CSO website: <http://www.cso.ie/px/u/NACECoder/NACEItems/searchnace.asp>.

The index system is structured on the non-financial traded services sector covered in the 2009 Annual Services Inquiry (ASI). This overall sector is broken down into 6* separate sectors:

- Wholesale and Retail Trade*; Repair of Motor Vehicles and Motorcycles (NACE 45-47)
- Transport and Storage (NACE 49-53)
- Accommodation and Food Activities (NACE 55,56*)
- Information and Communication (NACE 58-63)
- Business Services (NACE 69-75 and NACE 78-82)
- Other Business Services
 - NACE 66 Activities auxiliary to financial services and insurance activities
 - NACE 68 Real estate activities
 - NACE 77 Rental and leasing activities
 - NACE 90-93 Arts, Entertainment and Recreation
 - NACE 95 Repair of computers and personal and household goods
 - NACE 96 Other personal service activities

Each of these sectors is then broken down into three distinct cells based on both turnover and employment. Gross value added (GVA) baseweights are obtained from the ASI 2009 for each of these cells. Using a matched sample approach these baseweights are then updated each calendar month. A change in reported turnover is used as a proxy for a change in GVA to update the baseweights. The returned turnover figures for some enterprises are adjusted when enterprises' turnover is atypical of the GVA - turnover ratio within a sector. *The changes for the Retail, Motor and Bars components are obtained from the Retail Sales Inquiry. In the calculation of the index, Retail Trade and Motor Trade are treated as separate sectors. A Wholesale index is also published monthly.

Seasonal Adjustment Seasonal adjustment for each of the sectors is conducted using a direct seasonal adjustment approach. However, the overall MSI is estimated using the indirect approach, i.e. the MSI is derived by adding the weighted seasonally adjusted sub-components. The main reason for adopting the indirect to estimate the MSI is to improve the additivity of the MSI figures, i.e. monthly and annual changes in the MSI can be attributed directly to each of its sub-components. Seasonal adjustment models are developed for each series based on unadjusted data spanning from January 2009 to the current period. These models are then applied to the entire series. Seasonal factors are updated each month.

The adjustments are completed by applying the X-12-ARIMA model, developed by the U.S. Census Bureau to the unadjusted data. The ARIMA option in X12ARIMA is used to forecast and backcast the series in order to have enough data to run the seasonal adjustment, as currently we have less than 5 years of data. Due to the lack of a sufficiently long series the series are not adjusted for Easter and Trading effects. However seasonal estimates do take into account other factors that may impact on the quality of the seasonal adjustment, i.e. outliers, temporary changes and level shifts.

For additional information on the use of X-12-ARIMA see (Findley, D.F., B.C. Monsell, W.R. Bell, M.C. Otto, and B. Chen (1998), "New Capabilities and Methods of the X-12-Arima Seasonal Adjustment Program", *Journal of Business & Economic Statistics*, 16, pp. 127-177.)
