

### Agricultural price indices

Seasonally adjusted

## Agricultural Price Indices

### November 2001 (1995=100)

Seasonally adjusted

	Output	Input	Terms of trade
	1995 = 100		
<b>Oct 2001</b>	94.5	113.0	83.6
<b>Nov 2001</b>	95.4	112.6	84.7
<b>% change</b>	1.0%	-0.4%	1.3%

### Output price index up 1.0% in November

The seasonally adjusted total outputs index increased by 1.0% in November 2001 compared with October 2001. Increases in finished cattle, cows for slaughter, store cattle and sheep offset decreases in pigs, poultry, milk and potatoes. *See Table 3 and graph.*

The seasonally adjusted input price index decreased by 0.4%. Thus the terms of trade increased by 1.3% indicating a favourable price movement for farmers in the month.

Comparing November 2001 unadjusted agricultural price indices with the corresponding November 2000 indices shows that (*see Tables 1 and 2*):

- Feeding stuffs were up 4.0%, fertilizers were up 5.2% and energy prices were down 14.7%.
- Cattle, pigs and potatoes were down 6.5%, 3.2% and 13.0% respectively, while sheep were up 55.2%.

Annual changes in EU output and input price indices for selected items are shown at the back of this release.

## Background Notes

- Introduction** This release presents estimates of Agricultural Input and Output Price Indices. The indices monitor trends in prices paid to farmers for their produce and in prices paid by farmers for purchases of goods and services. The methodology is harmonised throughout the EU. The estimates are given to Eurostat, the Statistical Office of the European Communities. Preliminary annual indices, based on around nine months data, are also published each November.
- Methodology** The agricultural output price indices are intended to measure trends in the price of agricultural produce sold by farmers. The agricultural price indices are designed to measure trends in the price of farm inputs purchased for current consumption (i.e. non-capital materials and services). Traditionally both indices were compiled on the basis of the “national farm” concept. The weights used to combine the changes in prices of the individual commodities relate to the value of sales off farms or to the expenditure by farmers on input purchases. The old methodology excluded both the value of inter-farm sales and the value of own produce consumed in farm households. The new methodology includes the value of all sales of crop products between farms. The Laspeyres index formula, involving the use of fixed base year weights, has been used in the compilation of the monthly index numbers for all commodity groupings except vegetables. Because of the highly seasonal nature of vegetables, variable monthly baskets are used.
- Monthly price series are used except for seasonal products, such as seeds, where prices are only available at certain times during the year. In these cases, the monthly prices returned during the last selling period are continued unchanged until the product can be priced again. The monthly sub-indices are weighted by the value of sales off farms and the expenditure on farm inputs to derive overall monthly total input and total output indices. The annual indices are obtained either as a simple or weighted arithmetic mean of the corresponding monthly indices. From 1995, in line with EU recommendations, the annual input indices are calculated as simple arithmetic averages of the monthly indices.
- Price coverage** The index prices used are before deduction of levies and exclusion of value added tax with the exception of sugar beet where the A and B levies are deducted. Standardised prices are used for milk, cereals and sugar beet to ensure that products of identical quality are priced in successive periods. In the case of milk, this means pricing at a fixed butterfat and protein content and excluding special bonuses paid in respect of some deliveries to creameries. Standardised cereal prices take account of moisture content. Sugar beet prices are standardised at a fixed sugar content.
- Data sources** The indices are compiled from a wide variety of sources, including direct CSO surveys and administrative data from the Department of Agriculture, Food and Rural Development. The actual sources are described more fully in the Agricultural Price Indices 1990-2000 release published on the 8 February 2002.
- Livestock auction mart prices and export factory slaughterings prices are used for both cattle and sheep. Representative licensed export premises prices are used for pigs. Poultry prices at livestock auction marts and approved processing premises are used. For milk, the CSO collects prices from creameries. Feeding stuffs and fertilizers prices are collected through a CSO survey of merchants and co-operatives.
- Seasonal adjustment** As many agricultural products follow a seasonal production pattern, seasonally adjusted monthly series for the total indices and selected sub-indices are also published. The use of standardised prices for some commodities reduces the seasonality of these prices.
- Rebasing** The series are normally rebased every five years. This release shows monthly indices from January 2000 with base 1995=100. A rebased series covering the period 1990-2000 was published on the 8 February 2002 and contains a full note on methodology.
