Irish Life Tables

1985-1987 and 1990-1992

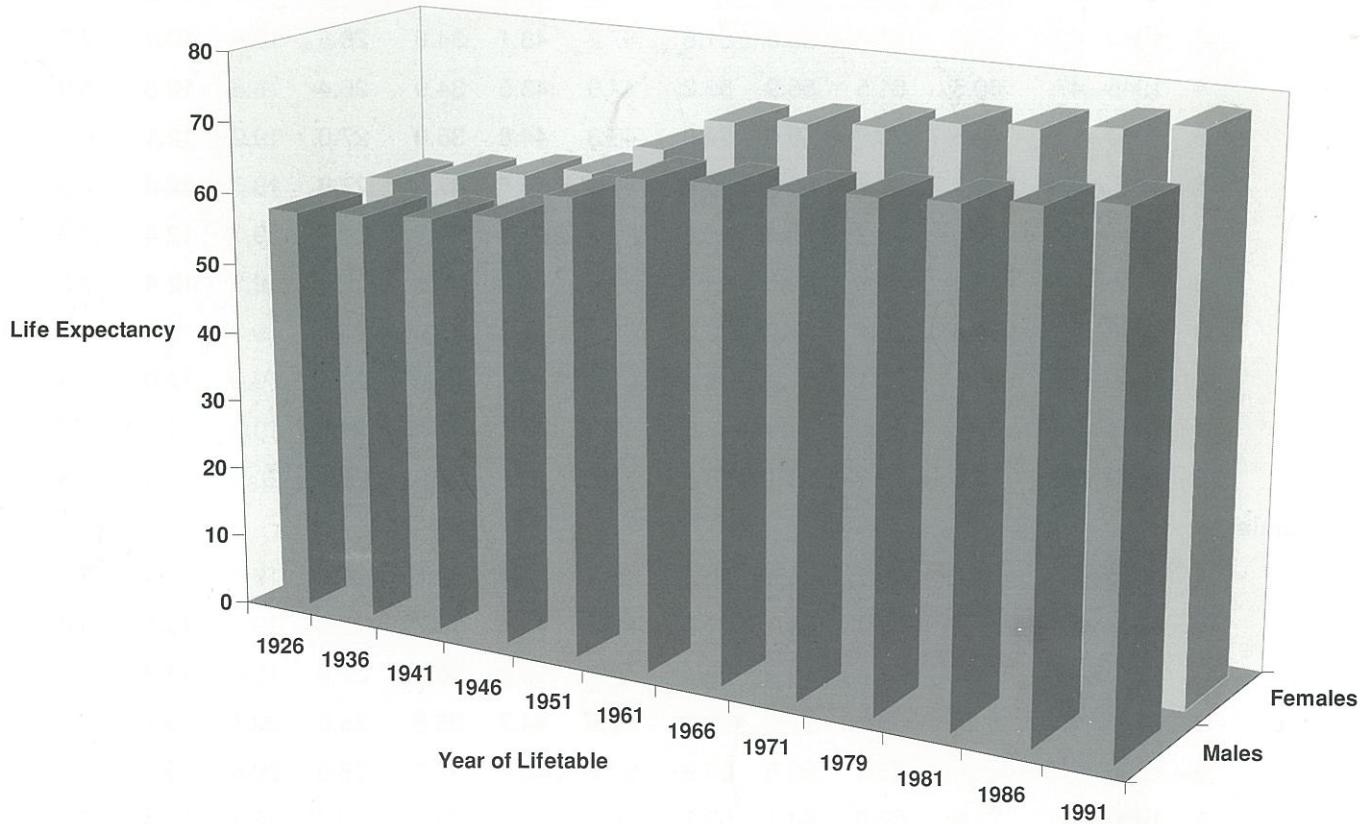

This release contains Life Tables for Ireland for the periods 1985-87 and 1990-92, and comparisons are made with earlier Life Tables. A Life Table measures average life expectancy at a given time. The calculation method used is independent of the current age structure of the population and involves no assumptions about future mortality rates. Further information on the method of constructing these Life Tables and a glossary of technical terms used in the tables are given on page 5. References to previous Life Tables are given on page 14.

Main Results

In 1991, males had a life expectancy at birth of 72.3 years while the life expectancy of females at birth was 77.9 years. This compares with life expectancies of 57.4 years and 57.9 years for males and females respectively in 1926.

Since 1981, life expectancy has increased by 2.2 years for males and 2.3 years for females.

Male and Female Life Expectancy at birth in each life table since 1926

Much of the improvement in life expectancy occurred between 1946 and 1961. Life expectancy improved more slowly in the 1960's and, in fact, fell marginally for males in some of the older age groups. Since 1971, life expectancy has increased more rapidly. Of particular note is the increasing rate of improvement for both men and women at ages 55, 65 and 75 since 1981.

The differential between male and female life expectation at birth, which increased from 0.5 years to 5.5 years between 1926 and 1979, has more or less stabilised since then. This differential stood at 5.5 years in both 1979 and 1981, increased to 5.7 years in 1986 and narrowed to 5.6 years in 1991.

Table 1 Expectation of Life at various ages, 1926–1991

Trends since 1981

Table 2 reviews trends in the rate of mortality for 1981, 1986 and 1991. The rate of mortality is the probability that a person who reaches a particular age dies within a year. Mortality is high in the first year of life, declines up to about 10 years of age and then becomes larger with increasing age.

Table 2 Rate of Mortality (q_x) 1981, 1986 and 1991

Age	Males			Females

90	.25763	.26536	.24583	.20868	.21463	.19504

Mortality rates decreased in most age groups for both males and females between 1981 and 1991. The greatest fall in mortality rates was at age zero, due to lower infant mortality. Against the general trend, mortality at ages 20 and 30 increased slightly between 1986 and 1991 for both males and females.

Table 3 summarises the life expectancy estimates at ages 0, 10, 20, etc. in 1981, 1986 and 1991. Over the time period covered by the last three Life Tables, life expectancy increased consistently for males and females at all ages except 90. Life expectancy at age 90 fell between 1981 and 1986 but increased above the 1981 level in 1991.

Table 3 Expectation of Life (e_0^x) 1981, 1986 and 1991

Age	Males			Females

International comparisons

The following table compares life expectancy in Ireland with other western European countries. Even though life expectancy for both Irish men and women has been improving over the years, it remains lower than in many other European countries. For many western European countries female life expectancy at birth is over 80 years while male life expectancy is in the 74 to 75 range.

Methodology

Life Tables

A Life Table is a method of deriving measures which are representative of average life expectancy prevailing at a given time. It is compiled in a manner that eliminates the effect of the current age composition of the population in question. This age composition may change over time and thus affect comparisons using other measures such as the number of deaths per 1,000 population.

A Life Table is a purely hypothetical calculation. The basic assumption is that a given cohort of births, 100,000, start in a given year. These are subject, as the survivors pass through each year of age, to the mortality rates prevailing for that age in the years for which the Life Table is being calculated. Thus, the Life Table deals with current mortality rates only and no assumptions are made about future changes. The mortality rates for each age are used to calculate how many of the cohort will reach each year of age until eventually all members of the cohort have died. This enables the total number of years lived by the cohort to be calculated. When this total is divided by the number of persons in the cohort, 100,000, the result is the average number of years lived by each member of the cohort or the mean expectation of life at birth. The total number of years lived by the cohort from any given age can also be calculated and, when divided by the number of survivors in the cohort entering upon that year of age, the figure obtained is the expectation of life in years for those persons.

Life Tables were constructed for males and females which are representative of the mortality experience in Ireland during the time periods in question. Thus, for the 1985–1987 Life Table the statistics of ages from the 1986 Census of Population and deaths enumerated in the three years 1985, 1986 and 1987 were used. Similarly for the 1990–1992 Table, the 1991 Census results and the number of deaths in the years 1990, 1991 and 1992 were relevant.

The Irish Statistical Bulletin, Sept. – Dec. 1985, contains further details on the construction of Life Tables. References to previous Life Tables are given on page 14.

Glossary of technical terms

Standard Life Table notation is used in the Tables:

- I_x the number of persons surviving to exact age x out of 100,000 aged 0.
- d_x the number of deaths in the year of age x to $x + 1$ out of I_x persons who enter that year.
- p_x the probability of living a year, or the ratio of the number completing the year of age x to $x + 1$ to the number entering on the year.
- q_x the rate of mortality, or the probability of dying in a year. It is the ratio of the number of deaths in the year of age x to $x + 1$ to the number entering on the year.
- L_x the population to be expected according to the Life Table aged between x and $x + 1$ years, assuming that 100,000 births occurred each year.
- T_x the population to be expected according to the Life Table above age x , assuming that 100,000 births occurred each year.
- $e^{\circ}x$ the expectation of life in years, or the total future life time in years which will on average be passed through by persons aged exactly x .

The following relations hold between these quantities:

$$p_x = 1 - q_x$$

$$I_x - I_{x+1} = d_x$$

$$L_x = \frac{1}{2} (I_x + I_{x+1}) \quad (x > 0)$$

$$T_x = \sum_{y \geq x} L_y$$

$$y \geq x$$

$$e^{\circ}x = T_x \div I_x$$

Note: An abbreviated version of Life Table No.11 has been published in the Statistical Abstract.

Population & Labour Force Projections 1996–2026

Price £25

The report contains projections of the:

- population classified by age and sex at five year intervals for the period 1996 to 2026; and
- labour force classified by age, sex and female marital status for 1996, 2001 and 2006.

Four sets of population projections and two sets of labour force projections are given, corresponding to combinations of assumptions relating to future trends in fertility, mortality, migration and labour force participation.

Purchase or order from:

**Government Publications Sale Office,
Sun Alliance House,
Molesworth Street,
Dublin 2.
Tel. (01) 661 3111**

or from:

**Central Statistics Office,
Information Section,
Skehard Road,
Cork
Tel. (021) 359000 Ext. 5029**

Population & Labour Force Projections Diskette

The Population and Labour Force Projections 1996–2026 are also available on diskette, at a price of £50. The diskette contains more detailed information than the publication, including projections of the population by sex and single year of age for each year from 1991 to 2026 and two "zero-migration" projections.

The diskette, which includes instructions for importing the data into Lotus or Excel spreadsheets, may be ordered from: Census Inquiries Section, Central Statistics Office, Ardee Road, Dublin 6 (Tel. 01–497 7144 ext. 4129, 4132, 4133 or 4134 Fax: 01 497 2360).
