Annual Production increased by 4.3% in September 2008

On an annual basis production for Manufacturing Industries for September 2008 was 4.3% higher than in September 2007 (*see above and Table 1*). The main contributor to the annual increase was the Basic chemicals sector (+42%). The seasonally adjusted volume of industrial production for Manufacturing Industries for the three month period July to September 2008 was 1.5% higher than in the preceding three month period (*see above and Table 4*).

The "Modern" Sector, comprising a number of high-technology and chemical sectors, showed an annual increase in production for September 2008 of 9.1% while a decrease of 7.3% was recorded in the "Traditional" Sector (*see Table 2*).

The seasonally adjusted industrial turnover index for Manufacturing Industries was 0.2% higher in the three month period July to September 2008 when compared with the preceding three month period (*see above and Table 7*). On an annual basis turnover was 0.8% lower when compared with September 2007.

For more information contact Patsy King on 021 453 5502, Mary Duggan on 021 453 5584 or Jane O'Brien on 021 453 5536.

Background Notes

Introduction	The monthly industrial production index monitors current trends in the volume of production of industrial local units with three or more persons engaged. The primary purpose of the index is to measure changes in value added at constant prices. The monthly index of turnover measures the change in the level of sales each month of industrial products, whether manufactured in the month in question or in previous periods (excluding non-industrial activity where practicable). The turnover indices outlined in this release are exclusive of VAT. The principal difference between the production and turnover indices is that the production index traces the quantitative volume of production (i.e. effect of price changes excluded) each month whether sold or not, whereas the turnover index reflects both the volume of sales and the price level. Starting with January 2004 updated industrial production and turnover indices are being published to base year 2000=100. The new orders indices measures trends in new orders accepted, including those received and filled during the last month. Orders are valued at the amounts invoiced or still to be invoiced (excluding VAT). The response rates for the provisional results are typically 45% in terms of the local units surveyed covering 80% of the value of production and 77% of the value of turnover. The corresponding figures for the final results are 56%, 91% and 89% respectively. These response rates are based on averages for a 12 month period.
Sample covered	The monthly survey which provides data for calculating the indices covers the larger local units which between them account for the bulk of industrial output – in general those which in the base year 2000 had twenty or more persons engaged. For certain sectors the threshold of 20 persons engaged is lowered where this is considered necessary to ensure representativeness of the sample or where data for a sector would have to be kept confidential if the 20 persons engaged threshold were applied. The business activity classifications are based on the Statistical Classification of Economic Activities in the European Community (Nace Rev.1.1).
Methodology	Working day adjusted individual production, turnover and new orders sub-indices are compiled for each detailed NACE class. These sub-indices are combined to provide the indices for broader sectoral groupings, using as weights for a sector the gross value added at factor cost for production indices, and turnover in goods produced and industrial services provided to others for turnover and new orders indices, for all units in that sector covered in the 2000 Census of Industrial Production (CIP). Weights and base year are revised every five years. The production index is compiled by valuing quantitative commodity data at base year prices. The series has been compiled using updated prices from the Prodcum 2000 survey. In cases where reliable quantity data cannot be obtained current value data is converted to values at base year prices using suitable Wholesale Price Index (WPI) deflators. New orders indices have been produced from January 2004 onwards using reported monthly orders data. In the event of non-response, the reported turnover is used as an estimate for the calculation of new orders indices.
Seasonal Adjustment	The data is seasonally adjusted using an X-11 procedure. This procedure is an adaptation of the US Bureau of the Census X-11 Seasonal Adjustment Program. This seasonal adjustment process is carried out once a year using the latest (currently up to and including December 2007) monthly production patterns available. Each index is independently seasonally adjusted i.e. the adjusted indices of groupings of sectors are not systematically derivable as weighted averages of their component parts.
Retrospection	To enable comparisons to be made with earlier periods efforts have been made to re-cast indices calculated under the previous system (base year 1995=100) to take account of the changes between the old and new systems. Aggregate indices prior to 2001 have been re-scaled to take account of the base year 2000=100.
NACE classification	The descriptions of particular NACE Rev. 1.1 sectors are sometimes shown in abbreviated form in the release. Fuller descriptions are given in recent Census of Industrial Production publications. When making comparisons with data produced in previous monthly industrial production releases (classified by NACE 70) it should be noted that the content of NACE Rev. 1.1 sectors can be quite different from that of similarly-titled NACE 70 sectors. From October 2006 it is no longer possible to report indices for NACE 16 and NACE 15-16 due to confidentiality.
