Agricultural Price Indices

August 2011

Unadjusted for seasonal factors

	Output	Input	Terms of trade
	Base year 2005 = 100		
July 2011	126.5	130.0	97.3
August 2011	127.0	129.9	97.8
% change	0.4%	0.0%	0.5%

Agricultural output price index up 0.4% in August 2011

The agricultural output price index increased by 0.4% in August 2011 compared with July 2011. The agricultural input price index remained unchanged over the same period. Thus, the resulting terms of trade index increased by 0.5% in August 2011. *See Tables 1A, 2A and graph.*

The seasonally adjusted output price index in August 2011 was 1.3% higher than in July 2011. *See Table 3.*

On an annual comparison, the agricultural output price index in August 2011 was 12.2% higher than in August 2010. The agricultural input price index was up 11.4% in August 2011 compared with August 2010.

A further comparison of the August 2011 sub-indices with August 2010 shows that:

- ◆ Cattle, milk and cereal prices increased by 18.6%, 13.0% and 6.2% respectively, while potatoes (incl. seeds) decreased by 33.7%. *See Table 1A.*
- ◆ Fertilisers, feeding stuffs and energy prices increased by 24.1%, 16.8% and 14.2% respectively. *See Table 2A.*

Annual EU output and input price index changes (base year 2005 = 100) for selected items are shown at the back of this release.

¹ The seasonally adjusted indices are recalculated each month for previous months.

.. Comparison not valid.

Background Notes

- Introduction** This release presents estimates of Agricultural Output and Input Price Indices. The indices monitor trends in prices paid to farmers for their produce and in prices paid by farmers for purchases of goods and services. An EU harmonised methodology is used to compile these price indices. The estimates are also sent to Eurostat, the Statistical Office of the European Communities.
- Methodology** The agricultural output price indices are intended to measure trends in the price of agricultural produce sold by farmers. The agricultural input price indices are designed to measure trends in the price of farm inputs purchased for current consumption (i.e. non-capital materials and services). Both indices are compiled on the average farm concept. The average farm concept includes both sales to other economic sectors as well as sales/purchases of agricultural output between agricultural units for intermediate consumption purposes, excluding trade in animals between agricultural units. The weights used to combine the changes in prices of the individual commodities are based on the value of sales off farms and the expenditure by farmers on input purchases for the base year for the output and input indices respectively. The Laspeyres index formula, involving the use of fixed base year weights, has been used in the compilation of the monthly index numbers for all commodity groupings except vegetables, potatoes and sheep. Because of the highly seasonal nature of vegetables, potatoes and sheep, variable monthly baskets of products are priced for these commodities.
- Monthly price series are used except for seasonal products where prices are only available at certain times during the year. In these cases, the monthly prices returned during the last selling period are continued unchanged until the product can be priced again. The monthly sub-indices are weighted by the base year value of sales and the expenditure on farm inputs to derive overall monthly total output and total input indices respectively. In line with EU recommendations, the annual input indices are calculated as simple arithmetic averages of the monthly indices. The annual output indices are calculated as the weighted averages of the monthly indices.
- The agricultural terms of trade index is the output price index expressed as a percentage of the input price index. All percentage changes have been calculated on actual figures before the index is rounded to one decimal place.
- Price coverage** The actual prices used for the index series are based on the market price without the deduction of bonuses, taxes or levies with the exception of deductible value added tax and third party levies. Standardised prices are used for milk and cereals to ensure that products of identical quality are priced in successive periods. In the case of milk for manufacturing, this means pricing at a fixed butterfat and protein content. Standardised cereal prices are based on the harvest price at 20% moisture content.
- Data sources** The indices are compiled from a wide variety of sources, including direct CSO surveys and administrative data from the Department of Agriculture, Fisheries and Food. The actual sources are described more fully in the *Agricultural Price Indices - Introduction of New Series to Base Year 2005 = 100* published by the CSO on the 15 July 2011. This report is available in electronic format from the CSO website at http://www.cso.ie/releasespublications/documents/prices/2011/api_baseyear2005.pdf
- Seasonal adjustment** As many agricultural products follow a seasonal production pattern, seasonally adjusted monthly series for the agricultural output price index and selected sub-indices are also compiled. As agricultural input prices are less subject to seasonal influences than output prices, a seasonally adjusted series is not relevant. Monthly indices starting in January 2005 have been used in deriving the seasonal factors. The seasonal adjustment is carried out by applying the X-12 ARIMA model, developed by the US Census Bureau, to the unadjusted data.

Annual % changes in EU output and input indices, base year 2005=100
