The Survey on Income and Living Conditions (SILC) in Ireland is a household survey covering a broad range of issues in relation to income and living conditions. It is the official source of data on household and individual income and also provides a number of key national poverty indicators, such as the at risk of poverty rate, the consistent poverty rate and rates of enforced deprivation. This report presents the results for 2012 and comparable data for previous years.

Note

Revised SILC results have been produced for reference years 2012-2014. See *Survey on Income and Living Conditions 2015*

Table A Summary of main results

	2007	2008	2009	2010	2011	2012

Summary of main findings

- In 2012, the median annual equivalised disposable income was €17,702 representing a decline of 2.5% on the nominal 2011 value, or 4.6% in real terms. See *table A and figure 1*.
- The 'at risk of poverty' rate was 16.5%, the deprivation rate stood at 26.9% and the consistent poverty rate was 7.7%. The corresponding rates for 2011 were respectively 16.0%, 24.5% and 6.9%. The changes in the at risk of poverty and consistent poverty rates are not statistically significant. See *tables A and 2*.
- The Gini coefficient in 2012 was 31.2%, not a statistically significant change on the 2011 value of 31.1%. See *table A*

Income

Equivalised Income

Figure 2 above shows the distribution of equivalised disposable income (red) for 2012. The distribution is positively skewed with a long tail. The median equivalised disposable income (green) was €17,702 and the at risk of poverty threshold (purple) stood at €10,621 i.e. 60% of the median. In 2012, 16.5% of individuals had an equivalised disposable income below this threshold. The mean equivalised disposable income (yellow) was €20,856 and just under 62% of individuals had an equivalised disposable income that was less than this amount. The value of the at risk of poverty threshold quoted above represents a decrease of 4.6% on the 2011 real (i.e. at 2012 prices) value of €11,133 and it continues a downward trend in the real value of the threshold from a peak of €12,409 in 2008. See table A and figure 2.

Real median equivalised disposable income has decreased every year since 2008 when it peaked at €20,681. The 2012 value is the lowest since the first reference year of the SILC in 2004. An analysis by socio-demographic characteristics shows that real median equivalised disposable income dropped for all groups with the exception of individuals living in households where there were three or more people at work. The groups that showed the largest drop in income were individuals with a highest level of educational attainment of “third level non degree” (-12.9%) and individuals living in households where there were two adults under 65 years of age and no children under 18 (-10.5%).

Individuals with a highest level of educational attainment of “third level degree or higher” continued to have the highest median income of the categories analysed in 2012, at €29,596. The real median income for this group in 2011 was €31,242. Once again individuals living in accommodation rented at below the market rate or rent free had the lowest median income of the categories analysed in 2012, at €12,593. The real median income for this group in 2011 was €13,149.

Real median equivalised disposable income for males was €18,039 in 2012, 2.7% higher than the corresponding figure for females (€17,561). Males however suffered a greater percentage drop in their income (6.1%) than females (2.4%) compared to the previous year.

Individuals living in the Southern and Eastern region had a real median equivalised disposable income (€18,694) that was 23.6% higher than those living in the Border, Midland and Western region (€15,124). Income for individuals living in the Border, Midland and Western region dropped by 7.5% on the 2011 value, compared to a drop of 4.7% for individuals living in the Southern and Eastern region.

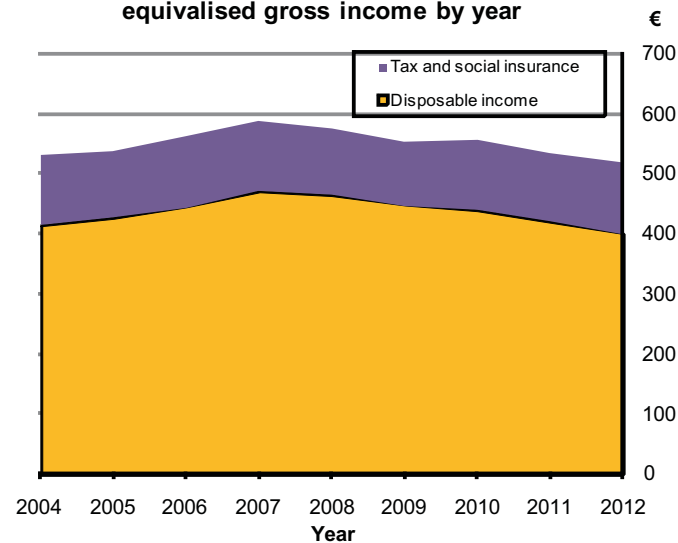

Figure 3 Composition of real mean weekly equivalised gross income by year

In 2012, real mean weekly equivalised gross income was €518.60, down from €534.58 in 2011 and €554.28 in 2010. See table 3b.

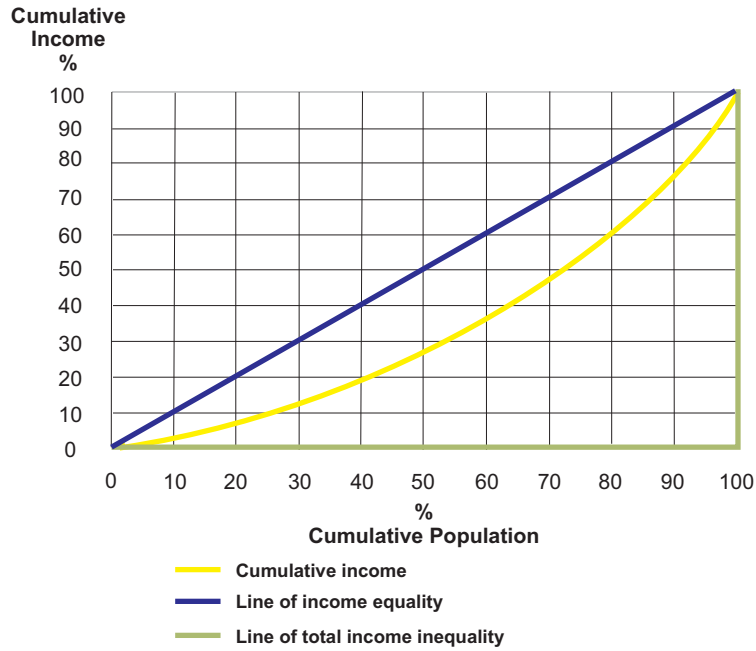

An analysis of the composition of gross equivalised income by year shows that real mean weekly equivalised direct income in 2012, at €379.97, has decreased steadily since 2007 when it peaked at €473.28. Real mean weekly equivalised social transfers decreased from €144.82 in 2011 to €138.63 in 2012, a decrease of just over 4%. See table 3b and figure 3.

Figure 4 Composition of real mean weekly equivalised gross income by year

A breakdown of gross equivalised income by disposable income, tax and social insurance payments showed a decline in real mean disposable income in 2012 (€399.69) from a peak of €471.65 in 2007. Mean weekly tax and social insurance contributions have increased every year since 2009 (€104.36) and stood at €118.91 in 2012. See table 3b and figure 4.

Figure 5 Income Inequality - Lorenz curve 2012

The Lorenz curve (yellow figure 5) plots cumulative equivalised disposable income versus the cumulative population ranked from the lowest to the highest (in terms of disposable income). The diagonal (blue) represents the line of complete equality, i.e. where every individual in the population receives the same income – in this case the Gini coefficient would be 0. The other extreme is the line of total inequality (green) where all the income is received by one individual – in this case the Gini coefficient would be 1. The Gini coefficient is calculated as the ratio of the area between the Lorenz curve and line of income equality divided by the area below the diagonal. In 2012 the Gini coefficient was 31.2% not a statistically significant change on the 2011 value of 31.1%. See table A.

Table B Share of Equivalised Income by Decile

	2005	2006	2007	2008	2009	2010	2011	2012
Deciles	%	%	%	%	%	%	%	%
1	3.3	3.5	3.4	3.5	3.6	3.2	3.0	3.0
2	4.7	4.8	4.9	5.1	5.2	5.0	5.0	4.9
3	5.6	5.7	5.7	5.9	6.1	5.9	6.0	6.0
4	6.7	6.6	6.6	6.8	7.0	6.8	6.9	6.9
5	7.8	7.7	7.7	7.9	8.1	7.8	7.9	7.9
6	9.2	8.9	9.0	9.1	9.3	9.1	9.2	9.1
7	10.5	10.3	10.6	10.4	10.6	10.3	10.5	10.5
8	12.1	12.1	12.3	12.2	12.3	12.0	12.4	12.4
9	14.5	14.7	15.1	14.7	14.8	15.2	15.2	15.2
10	25.6	25.9	24.7	24.4	23.2	24.7	24.0	24.0

Table B above shows the share of income received by each decile from 2005 to 2012. Overall the distribution of income across the deciles in 2012 has changed little since 2011 and this is reflected in the quintile share ratio. The quintile share ratio is the share of income of the highest income quintile divided by the share of income of the lowest income quintile, and was 5.0 in 2012. The corresponding value for 2011 was 4.9. See table B and figure 6.

Figure 6 Indicators of income inequality by year

Poverty

Figure 7 Poverty and deprivation rates by year

At risk of poverty

In 2012, the ‘at risk of poverty’ rate was 16.5% compared to 16.0% in 2011. The change is not statistically significant. An analysis by socio-demographic characteristics showed that those most at risk of poverty in 2012 were those living in households where there was no one at work (36.6%) and unemployed persons (34.7%). The ‘at risk of poverty’ rate for persons living in accommodation that was rented at below the market rate or rent free was almost as high at 33.9%. See table 2.

Figure 8 The at risk of poverty rate including and excluding social transfers by year

In 2012, if all social transfers were excluded from income, the ‘at risk of poverty’ rate would be 50.3%. The corresponding figure for 2005 was 40.1%. This increase over time demonstrates the increased dependence of individuals on social transfers to remain above the ‘at risk of poverty’ threshold. See table 5 and figure 8.

Deprivation

In 2012, almost 27% of the population experienced two or more types of enforced deprivation. This compares with 24.5% in 2011 and a six year low of 11.8% in 2007.

An analysis by other socio-demographic characteristics showed that those living in accommodation that was rented at below the market rate or rent free had the highest deprivation rate in 2012 at 50.7%. Those living in households with one adult and one or more children under 18 (49.5%) and those describing their principal economic status as unemployed (49.4%) also had high levels of deprivation in 2012. See tables A and 2.

Deprivation by poverty status

The deprivation rate for those at risk of poverty was 46.8% in 2012 compared with 43.2% in 2011. The deprivation rate for those NOT at risk of poverty was 23.0% in 2012, compared with 21.0% in 2011. See table 6.

Types of deprivation

At an overall level in 2012, the types of deprivation most commonly experienced were an inability to: replace worn out furniture (24.5%), afford a morning/afternoon/evening out (23.3%) and have family/friends over for a meal/drink (16.1%). For those ‘at risk of poverty’ the types of deprivation most commonly experienced were an inability to; afford a morning/afternoon/evening out (37.2%), replace worn out furniture (37.1%), and have family/friends over for a meal/drink (28.8%). For those not ‘at risk of poverty’ the types of deprivation most commonly experienced were an inability to; replace worn out furniture (22.0%), afford a morning/afternoon/evening out (20.6%) and have family/friends over for a meal/drink (13.6%). See table 7.

Consistent Poverty

The consistent poverty rate in 2012 was 7.7% compared with 6.9% in 2011, not a statistically significant change.

Further analysis by key socio-demographic variables showed that those living in accommodation that was rented at below the market rate or rent free (19.8%), unemployed individuals (19.2%) and individuals living in households where there was no one at work (18.8%) had the highest consistent poverty rates in 2012.

An analysis of consistent poverty rates by principal economic status shows that the consistent poverty rate is highest among individuals who were unemployed (19.2%) and individuals who were not at work due to illness or disability (17.6%). Individuals who were at work had the lowest consistent poverty rate at 1.9%. An analysis of the rates by household composition shows that individuals living in households where there was one adult and one or more children under 18 continued to have the highest consistent poverty rate in 2012 at 17.4%. The consistent poverty rate for individuals living in households where there was one adult aged under 65 and no children under 18 was also high at just over 16%. See table 2.

Background Notes

Purpose of survey

The primary focus of the Survey on Income and Living Conditions (SILC) is the collection of information on the income and living conditions of different types of households in Ireland, in order to derive indicators on poverty, deprivation and social exclusion. It is a voluntary (for selected respondents) survey of private households. It is carried out under EU legislation (Council Regulation No 1177/2003) and commenced in Ireland in June 2003. This release presents results based on data collected in the period January 2012 to January 2013.

Definitions of Income

Gross income

Income details are collected at both a household and individual level in SILC. In analysis, each individual's income is summed up to household level and in turn added to household level income components to calculate *gross household income*. The components of gross household income are:

Direct Income:

Employee income:

Gross employee cash or near cash income

Gross non-cash employee income

Employer's social insurance contributions

Gross cash benefits or losses from self-employment

Other direct income:

- Value of goods produced for own consumption
- Pension from individual private plans
- Income from rental of property or land
- Regular inter-household cash transfers received
- Interests, dividends, profit from capital investments in unincorporated business
- Income received by people aged under 16

Social Transfers:

Unemployment related payments

Old-age related payments

Family/children related allowances:

- Maternity/adoptive benefit
- Child benefit
- Single parent allowances
- Carers' benefit

Housing allowances:

- Rent supplement
- Free phone/electricity etc
- Fuel allowances
- Exceptional needs payments

Other social transfers:

- Survivors' benefits
- Sickness benefits
- Disability benefits
- Education-related allowances
- Social exclusion not elsewhere classified

Disposable income Tax and social insurance contributions are also summed to household level and subtracted from the gross household income to calculate the *total disposable household income*. The components of disposable household income are gross household income *less*:

Employer's social insurance contributions
Regular inter-household cash transfer paid
Tax on income and social insurance contributions
Tax deducted at source from individual private pension plans

Real/Nominal income figures Both nominal and real income figures are included in this release. Real income figures have been adjusted for inflation by applying a deflator to the nominal income figures. The deflator is derived from the monthly CPI and takes into account the rolling nature of the income data collected by SILC.

Equivalence scales Equivalence scales are used to calculate the *equivalised household size* in a household. Although there are numerous scales, we focus on the national scale in this release. The national scale attributes a weight of 1 to the first adult, 0.66 to each subsequent adult (aged 14+ living in the household) and 0.33 to each child aged less than 14. The weights for each household are then summed to calculate the *equivalised household size*.

Equivalised disposable household income Disposable household income is divided by the *equivalised household size* to calculate equivalised disposable income for each person, which essentially is an approximate measure of how much of the income can be attributed to each member of the household. This *equivalised income* is then applied to each member of the household.

Indicators

At risk of poverty rate This is the share of persons with an equivalised income below a given percentage (usually 60%) of the national median income. It is also calculated at 40%, 50% and 70% for comparison. The rate is calculated by ranking persons by equivalised income from smallest to largest and then extracting the median or middle value. Anyone with an equivalised income of less than 60% of the median is considered *at risk of poverty at a 60% level*.

Deprivation rate Households that are excluded and marginalised from consuming goods and services which are considered the norm for other people in society, due to an inability to afford them, are considered to be deprived. The identification of the marginalised or deprived is currently achieved on the basis of a set of eleven basic deprivation indicators:

1. Two pairs of strong shoes
2. A warm waterproof overcoat
3. Buy new (not second-hand) clothes
4. Eat meat with meat, chicken, fish (or vegetarian equivalent) every second day
5. Have a roast joint or its equivalent once a week
6. Had to go without heating during the last year through lack of money
7. Keep the home adequately warm
8. Buy presents for family or friends at least once a year
9. Replace any worn out furniture
10. Have family or friends for a drink or meal once a month
11. Have a morning, afternoon or evening out in the last fortnight for entertainment

Individuals who experience two or more of the eleven listed items are considered to be experiencing enforced deprivation. This is the basis for calculating the deprivation rate.

Consistent poverty

The consistent poverty measure looks at those persons who are defined as being at risk of poverty and experiencing enforced deprivation (experiencing two or more types of deprivation).

An individual is defined as being in ‘consistent poverty’ if they are:

- Identified as being at risk of poverty and
- Living in a household deprived of two or more of the eleven basic deprivation items listed above.

(Note that it is enforced deprivation that is relevant in this context. For example, a household may not have a roast once a week. The household is classified as deprived of this basic indicator only if the reason they didn't have it was because they could not afford it.)

Relative at risk of poverty gap

This is the difference between the median equivalised income of persons below the at-risk-of-poverty threshold and the at-risk-of-poverty threshold, expressed as a percentage of the at-risk-of-poverty threshold. The purpose of the indicator is to measure how far below the poverty threshold the median income of people at risk of poverty is. The closer the median income of those at risk of poverty is to the at risk of poverty threshold the smaller the percentage will be.

At risk of poverty rate before social transfers

This indicator is calculated based on two alternative measures of equivalised income. The first calculates equivalised income as the total disposable household income including old-age and survivors’ benefits but excluding all other social transfers. The second excludes all social transfers. Any person with an equivalised income before social transfers of less than 60% of the median **after** social transfers is considered at risk of poverty before social transfers (i.e. the same threshold is used for calculating the rate before and after social transfers).

At risk of poverty rate anchored at a moment in time

For a given year, the “at risk of poverty rate anchored at a moment in time” is the share of the population whose income in a given year is below the at risk of poverty threshold calculated in the standard way for a previous base year and then adjusted for inflation. The purpose of this indicator is to get some indication of the changes in ‘absolute poverty’ over time. In this release four separate base years were used. If the base year is 2004 for example then the at risk of poverty threshold for 2004 is adjusted in line with inflation for each year 2005-2012. The same method is followed for 2005, 2006 and 2007. The deflator used here is the same as that used to calculate real income.

Gini coefficient

This is the relationship between cumulative shares of the population (ranked according to the level of income from lowest to highest) and the cumulative share of total income received by them. If there was perfect equality (i.e. each person receives the same income) the Gini coefficient would be 0%. A Gini coefficient of 100% would indicate there was total inequality and the entire national income was in the hands of one person.

Calculation of the Gini Coefficient

$$Gini = \frac{2\left(\sum_{i=1}^n Wgt_i \times Eq_inc_i \times \sum_{j=1}^i Wgt_j\right) - \sum_{i=1}^n (Wgt_i)^2 \times Eq_inc_i}{\left(\sum_{i=1}^n Wgt_i\right) \times \sum_{i=1}^n (Wgt_i \times Eq_inc_i)} - 1$$

Wgt_i = Final calibrated weight per individual

Eq_inc_i = Equivalised disposable income

$\sum_{j=1}^i Wgt_j$ = Cumulative income

Inequality of income distribution (S80/S20) quintile share ratio

This is the ratio of the average equivalised income received by the 20% of persons with the highest income (top quintile) to that received by the 20% of persons with the lowest income (lowest quintile).
